

FINAL

**ENVIRONMENTAL CONDITION OF PROPERTY
REPORT**

**WESTOVER
U.S. ARMED FORCES RESERVE CENTER (MA007)
160 AIRMAN DRIVE
CHICOPEE, MA 01022**

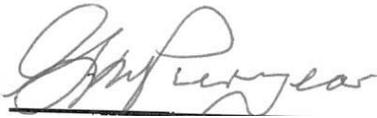

Prepared For:

**U.S. Army Corps of Engineers – Louisville District
Engineering Division – Environmental Engineering Branch
600 Dr. Martin Luther King, Jr. Place
Louisville, Kentucky 40202-2232**

FEBRUARY 2007

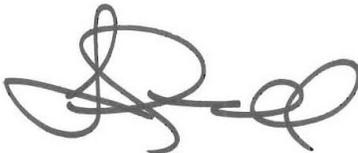

CERTIFICATION

All information/documentation provided accurately reflects the environmental condition of the property. This ECP Report is in general accordance with the U.S. Department of Defense (DoD) requirements for completion of an Environmental Condition of Property (ECP) Report.

GARY PURYEAR **DATE**
Environmental Division ARIM
Chief Environmental Division
94th Regional Readiness Command

The undersigned certifies the contents of this report are in general accordance with DoD policies for the completion of an ECP.

Project Geologist
U.S. Army Corps of Engineers

Executive Summary

CH2M HILL, under contract to the U.S. Army Corps of Engineers (USACE), Louisville District, prepared this Environmental Condition of Property (ECP) Report for the Westover U.S. Armed Forces Reserve Center (USAFR Center) (Facility ID MA007), hereafter referred to as the "Site," the "Property," or "USAFR Center." The Site is located in Chicopee, Massachusetts, and encompasses approximately 12.42 acres.

This ECP was conducted in conformance with the Department of Defense's Base Redevelopment and Realignment Manual (BRRM), DoD 4165.77-M, Army Regulation 200-1, and the American Society for Testing and Materials (ASTM) Designation D 6008-96 (2005) *Standard Practice for Conducting Environmental Baseline Surveys*.

This ECP details the history of the property including prior tenant use; however, the focus of this document is on the USAFR Center use of the property and the resulting environmental condition of the Site.

The USAFR Center is located in Hampden County, on the northeast side of the city of Chicopee, Massachusetts, at 160 Airman Drive (Figure 1, Appendix A). The 12.42-acre parcel is an irregular-shaped property entirely located within the current boundaries of Westover Air Reserve Base (ARB), formerly Westover Air Force Base (AFB), and is situated west of the runway. The USAFR Center is located on a northern boundary of Westover ARB. Air Force barracks and dormitories lie to the Center's west, a radar tower lies to the east, and the base exchange (BX) (grocery store) to the south. The USAFR Center is currently occupied by the 226th Transportation Company (Army), 287th Medical Dental Unit (Army), 25th Tube launched, Optically tracked, Wire-guided missile (TOW) Platoon (Marines), Marine Corps Recruiters, Navy Recruiters, and the Hampden County Sheriffs Academy.

The Property also is improved with a privately owned vehicle (POV) parking lot, two military equipment parking (MEP) areas, and landscaped grounds, part of which is located across Airman Drive to the west (Figure 2, Appendix A). Approximately one-third of the 12.42-acre tract is considered impervious (asphalt parking areas, driveways, concrete walkways, building footprints, etc.), while the remainder is covered by lawn and a considerable population of oak trees.

Southern portions of the Property, including the MEP areas and the Organizational Maintenance Shop (OMS) building, are secured by fencing. The remainder of the Property, including the Administration Building and POV parking area, is open to South Main Street. Since the USAFR Center is located completely within the boundaries of Westover ARB, access is limited to the Property.

Based on a review of aerial photographs, U.S. Geological Survey (USGS) topographical maps and historical documents, the Property was used as tobacco farming before the Air Force took over the land in the 1940s, and was used by the Air Force as an Air Force Service club until it was turned over to the U.S. Army in 1976. It has since been used as a USAFR Center. The original buildings on the Property were constructed in 1959 when it was used

by the Air Force as an Air Force Service Club. In 1978, the Army added an addition to the administration building and constructed an OMS.

Reserve personnel historically have conducted administrative, logistical, and training activities at the Property, with limited vehicle maintenance occurring in the OMS building.

Areas of potential environmental concern were reviewed and Contractor CH2M HILL found the following relating to the USAFR use of this property:

- Subsurface environmental conditions on the Westover ARB that have significant potential to impact the USAFR Center.

In accordance with Department of Defense policy defining the classifications (see Sherri Goodman Memorandum dated 21 October 1996), the Property has been classified as Type 7. This classification does not include categorizing the property based on *de minimus* conditions that generally do not present material risk of harm to the public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

1 Introduction

CH2M HILL, under contract to the U.S. Army Corps of Engineers (USACE) Louisville District Engineering Division was authorized to conduct an Environmental Condition of Property (ECP) report for the Westover U.S. Armed Forces Reserve Center (MA007). The facility is located at 160 Airman Drive, Chicopee, Hampden County, Massachusetts, 01022, and is hereafter referred to as the "Site," the "Property," or "USAFR Center." CH2M HILL prepared this ECP report under contract number W912QR-04-D-0020, Task Order No. 0018, with the USACE Louisville District.

A visual non-intrusive (for example, no sampling) reconnaissance of the Property was conducted on September 6, 2006, in support of the ECP. The reconnaissance purpose was to obtain visual information indicating the likelihood of recognized environmental conditions associated with the Property or adjacent properties.

In preparing this ECP report, CH2M HILL gathered information from the available records and previous work from others, interviews with individuals purporting to be familiar with the Property, and observations from a site reconnaissance. The accuracy of the information obtained from these sources was not verified by CH2M HILL. As such, CH2M HILL will make no warranty, expressed or implied, relative to the accuracy, completeness, or reliability of the information used to create the records and reports prepared by others.

1.1 Purpose of Environmental Condition of Property

The Military Department with real property accountability shall assess, determine and document the environmental condition of all transferable property in an ECP Report. This ECP Report is based on readily available information. Pursuant to the Department of Defense's (DoD) policy, set forth in the Base Redevelopment and Realignment Manual (BRRM) (DoD 4165.66-M, March 1, 2006) Section C8.3, the primary purposes of the ECP Report include the following:

- Provide the Army with information it may use to make disposal decisions.
- Provide the public with information relative to the environmental condition of the property.
- Assist in community planning for the reuse of Base Realignment and Closure (BRAC) property.
- Assist Federal agencies during the property screening process.
- Provide information for prospective buyers.
- Assist prospective new owners in meeting the requirements under U. S. Environmental Protection Agency's (USEPA) "All Appropriate Inquiry" regulations.
- Provide information about completed remedial and corrective actions at the property.

- Assist in determining appropriate responsibilities, asset valuation, and liabilities with other parties to a transaction.

The ECP Report contains the information required to comply with the provisions of 40 Code of Federal Regulations (CFR) Part 373, which require that a notice accompany contracts for the sale of, and deeds entered into, for the transfer of federal property on which any hazardous substance was stored, released or disposed of. The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Section 120(h) stipulates that a notice is required if certain quantities of designated hazardous substances have been stored on the property for 1 year or more—specifically, quantities exceeding 1,000 kilograms (kg) or the reportable quantity, whichever is greater, of the substances specified in 40 CFR 302.4 or 1 kg of acutely hazardous waste as defined in 40 CFR 261.30. A notice is also required if hazardous substances have been disposed of or released on the property in an amount greater than or equal to the reportable quantity. Army Regulation (AR) 200-1 requires that the ECP Report address asbestos, lead-based paint (LBP), radon and other substances potentially hazardous to human health.

This ECP Report used the American Society for Testing and materials (ASTM) Designation D 6008-96 (2005), *Standard Practice for Conducting Environmental Baseline Surveys*, the BRRM, CERCLA § 120, and Army Regulation 200-1.

1.2 Scope of Services

This ECP report covers the 12.42-acre USAFR Center located at 160 Airman Drive, Chicopee, Massachusetts. The Property is located within Westover Air Reserve Base (ARB) with the base boundary on the Property's northern border. All site maps, figures, and aerial photographs referenced herein are provided in Appendix A, while Appendix B contains the photographs taken during the September 6, 2006, site reconnaissance. Appendix C contains the Property warranty deeds and chain of title information, and lease or permit agreements if applicable. Relevant historical environmental documents and reports are provided in Appendix D, while Appendix E contains the Environmental Data Resources, Inc. (EDR) radius search reports commissioned for this effort.

This ECP report classifies the property into one of seven DoD Environmental ECP categories as defined by the DoD policy defining the classifications (see Sherri Goodman Memorandum dated 21 October 1996). The property classification categories are as follows:

- ECP Area Type 1—An area or parcel of real property where no release or disposal of hazardous substances or petroleum products or their derivatives has occurred (including no migration of these substances from adjacent properties).
- ECP Area Type 2—An area or parcel of real property where only the release or disposal of petroleum products or their derivatives has occurred.
- ECP Area Type 3—An area or parcel of real property where release, disposal, or migration, or some combination thereof, of hazardous substances has occurred, but at concentrations that do not require a removal or remedial action.

- ECP Area Type 4 – An area or parcel of real property where release, disposal, or migration, or some combination thereof, of hazardous substances has occurred and all remedial actions necessary to protect human health and the environment have been taken.
- ECP Area Type 5 – An area or parcel of real property where release, disposal, or migration, or some combination thereof, of hazardous substances has occurred and removal or remedial actions, or both, are underway, but all required actions have not yet been taken.
- ECP Area Type 6 – An area or parcel of real property where release, disposal, or migration, or some combination thereof, of hazardous substances has occurred, but required response actions have not yet been initiated.
- ECP Area Type 7 – An area or parcel of real property that is unevaluated or requires additional evaluation.

2 Site Location and Physical Description

2.1 Site Location

The USAFR Center is located in Hampden County, on the northeast side of the city of Chicopee, Massachusetts, at 160 Airman Drive. The 12.42-acre parcel is located within Westover AFB with the base boundary on the Properties northern border (Figure 1, Appendix A).

2.2 Asset Information

Facility Name and Address:	Westover U.S. Armed Forces Reserve Center 160 Airman Drive Chicopee, Massachusetts
Property Owner:	U.S. Government
Date of Ownership:	Acquired by U.S. Air Force in 1939, transferred to U.S. Army on September 11, 1976
Current Occupant:	226th Transportation Company (Army), 287th Medical Dental Unit (Army), 25th Tube-launched, Optically tracked, Wire-guided missile (TOW) Platoon (Marines), and the Hamden County Sheriffs Academy
Zoning:	Military
County, State:	Hampden, Massachusetts
USGS Quadrangle(s):	Springfield North
Latitude/longitude:	42°11'37"N; 72°33'27"W
Legal Description:	The USAFR Center includes 12.42 acres of land. No deeds, leases or titles were reviewed for the ECP report.

2.3 Physical Description

The USAFR Center contains two permanent structures and three parking lots. Construction of the 42,000-square-foot administration building (Building 5550) was completed in 1959, while the 5,800-square-foot Organizational Maintenance Shop (OMS) (Building 5551), approximately 250 feet south, was completed in 1978. Both structures have flat roofs and are on concrete foundations, and consist of concrete block walls covered with a brick veneer. Two military equipment parking (MEP), MEP 1 and 2, areas and a privately owned vehicle (POV) parking area also are contained within the Property. Approximately one-third of the Property is covered by impervious surface features such as asphalt parking areas,

driveways, concrete walkways, and building footprints. The remaining land is grassed with a robust population of oak trees, especially clustered on the parcel east of Airman Drive (Figure 2, Appendix A).

The Administration Building consists of two components: an original cruciform-plan structure built in 1959 and a rectangular addition to the northern arm completed in 1978 at the same time as the OMS. The original cruciform corridor is a one-story, 245-foot-long structure, while the addition is a two-story, 136-foot-long structure. Interior features include administrative offices, classrooms, arms vault, storage lockers, showers, a boiler room, kitchen, drill hall, weapon simulator, and equipment storage.

The facility currently houses the 226th Transportation Company (Army), which facilitates transportation and fuel resources for forward units in the event of mobilization; the 287th Medical Dental Unit (Army), which provides dental assistance for troops in field environments; the 25th Platoon (Marines), the TOW unit; the Hamden County Sheriffs Academy; a Marine Corps recruiter; and a Navy recruiter.

The OMS (Building 5551) is a one-story, brick building with five roll-type garage doors, three of which are located in the taller, main portion of the building with two smaller doors located in the shorter wing at the west end of the building. A fenced parking lot MEP 2 is located immediately to the east of the building. A hydraulic lift used for minor maintenance on equipment is located in the OMS (Photograph 1, Appendix B). At the time of the site reconnaissance, there were 30 to 40 vehicles at the OMS, including two heavy-duty fork lifts and a large crane.

The wash rack area, located near the OMS (Photograph 2, Appendix B) consists of a cement pad that drains to a floor drain connected to an oil/water separator (OWS); wash fluid then flows to the sanitary sewer. The wash rack uses two water spouts connected to the City of Chicopee water supply for vehicle cleaning. An oil stain was observed near the drain at the time of the site reconnaissance.

2.4 Site Hydrology and Geology

The USAFR Center and Chicopee are located within the Connecticut Lowlands Zone of the Eastern Connecticut River Valley. The Connecticut River Valley is bounded to the west by the Berkshire Mountains and to the east by the Worcester Plateau. The distinct north-south trend of the Connecticut River reflects the fracturing and collision of the North American and African crustal plates during the Ordovician and Devonian period approximately 350 million years ago (Hartshorn and Colton, 1967).

The area around Chicopee geographically is dominated by the Connecticut River floodplain, typically consisting of nearly level floodplains and gently sloping terraces, punctuated by steep intrusive dikes. Outside the floodplain are glacial lake sediments and other glacial features caused during the most recent glacial period. Surface elevations range from 40 feet above mean sea level (msl) to 260 feet above msl in the Chicopee area.

2.4.1 Surface Water Characteristics

Figure 3 in Appendix A provides a portion of the 1958, Springfield North U.S. Geological Survey (USGS) topographic map that includes the Property. As shown, the Property is situated at an elevation of approximately 250 feet above msl and is relatively flat. In the immediate vicinity of the Property, the land surface is situated on a plateau that slopes west toward Williamson Brook that feeds into Langewald Pond and Mountain Pond, which eventually drain to the Connecticut River.

Stormwater sheet flow from the MEP area and POV parking lots collects in storm drains, which drain to four outfall points. The first outfall point collects runoff from within MEP 1 and directs stormwater southwest along Galaxy Road, eventually discharging to Williams Brook. Outfalls two and three collect runoff from the pavement in front of the OMS and the southern edges of the POV parking area, respectively. These two outfalls discharge to the storm sewer on Airman Drive, which flows southwest toward Galaxy Drive and ends up in Williams Brook. The fourth outfall drain collects runoff from the northern side of the POV parking lot and discharges to the storm sewer system, which flows west to Williams Brook.

No surface water features are located on the Property, although according to the 1979 USGS topographic map, an intermittent brook appears along the western border of the USAFR Center. During the site reconnaissance, no signs of wetlands were observed in this area. Langewald Pond appears 1,000 feet west of the USAFR Center.

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map, the Property is not located in the 100-year floodplain nor does a floodplain appear within 0.5 mile of the USAFR Center.

2.4.2 Hydrogeological Characteristics

The soils at the Property are classified as Urban Land and nearly level to moderately sloping Hinckley and Windsor soils on glacial outwash terraces (Project Facilities, 2004). These soils are deep and excessively well drained. Underlying bedrock formations in the Chicopee area generally consist of reddish-brown sedimentary sandstones and shales. These shales contain an abundance of floral and faunal fossils. There also are a series of well-developed diabase dikes.

During removal of an underground storage tank (UST) in 1992, the soil that was uncovered was characterized as medium-brown silty fine sand with little fine to medium gravel to at 6 feet deep. No groundwater was observed during the excavation.

The USAFR Center is located in an area of a potentially productive aquifer (EDR, 2006; Appendix E). The inferred groundwater flow direction is not listed in the EDR report nor are there any wells near the USAFR Center. From topography and fluvial features close to the USAFR Center, groundwater flow direction is inferred to be flowing southwest.

2.5 Site Utilities

Water Service—The City of Chicopee provides potable water service to the Property.

Sanitary Sewer System—The City of Chicopee provides sanitary sewer service to the Property. The primary source of wastewater that is directed to the city sewer system includes nonprocess wastewater (bathrooms, sinks, etc.), vehicle washing runoff, OWS runoff, and drains located throughout the Property.

Gas and Electric—Bay State Gas provides natural gas service to the Property, while National Grid provides electric service to the Property.

2.6 Water Supply Wells and Septic Systems

Based upon a review of available historical site and agency records and interviews with site personnel, neither a water supply well nor a septic system is or was located at the Property. Potable water is supplied by the City of Chicopee.

A search of federal and state water well databases identified one public water supply source located approximately 0.75 mile northeast of the Property. The well is owned by the Massachusetts Department of Environmental Management (DEM) State Forest and is an untreated well that has no major violations or enforcement.

3 Site History

3.1 History of Ownership

The site was used for tobacco farming prior to 1939, which is when Westover Air Force Base (AFB) was built (Project Facilities, 2004). In 1976, when Westover AFB was deactivated, the Air Force transferred the facility to the U.S. Army for use as a Reserve facility.

3.2 Past Uses and Operations

According to historical documentation, the U.S. Government constructed Westover AFB in 1939 and activated it in 1940 as a bomber base. Between 1947 and 1955, the base was the largest freight and passenger terminal in the Military Air Transport System (MATs) and was used extensively during the Berlin Airlift. According to Westover AFB records, the building present at the site in 1969 was used as an Air Force Service Club. The base was deactivated in 1976, at which point the Property currently occupied by the USAFR Center was transferred to the U.S. Army. The Administration Building (Building 5550) was then altered and enlarged to a 300-man capacity, adding the north wing and the OMS.

After the USAFR Center was rededicated on September 11, 1976, it was used for administrative, operations, and recruiting space for the U.S. Army, U.S. Navy, and the U.S. Marines Corps. The USAFR Center served (and still serves) as a base of operations for specialized units that can be mobilized and assimilated into the Regular Army when required.

The Property primarily functioned as an administrative, logistical, and educational facility, with limited maintenance of military vehicles occurring in the OMS building. The Property historically was used by reservists for drill activities on various weekends throughout the year. The OMS building was used to perform minor maintenance activities on military equipment. Activities inside the OMS building were limited to preventative maintenance checks, including checking vehicle fluids, such as motor oil, water, and antifreeze, and light maintenance activities. Any equipment requiring heavier maintenance activities was sent to an Area Maintenance Support Activity (AMSA) shop located at one of the other Reserve centers. Equipment requiring major overhaul also was sent offsite. A hydraulic floor jack pit was observed in the OMS (Photograph 3, Appendix B). An associated hydraulic oil pump and hydraulic jacks had not been removed (Photograph 4, Appendix B), even though Property personnel stated the pit had not been used in some time.

Vehicle washing would have occurred historically at the wash rack (Photograph 2, Appendix B) just north of the OMS building. One drain located in the middle of the cement pad carries rinse water to an OWS (Photograph 5, Appendix B) located in the MEP area, which is connected to the municipal sanitary sewer. No storage tanks are associated with the OWS.

Historical aerial photographs and topographic maps were the primary source of information on the past use and operations at the Property. Figures 3 through 7 in Appendix A provide USGS topographical maps and aerial views of the Property and surrounding areas in 1958, 1960, 1972, 1979, and 1980.

The 1958 USGS topographical map (Figure 3, Appendix A) shows the Property as developed with three large H-shaped structures and four smaller buildings. These structures were associated with an Air Force Service Club. The surrounding areas are developed with buildings; two schools appear north of the USAFR Center, and Westover AFB lies to the west.

The 1960 aerial photograph (Figure 4, Appendix A) shows four buildings located on the Property. Two of the buildings were present on the previous topographic map: the H-shaped building and one of the smaller buildings to the south of the Property. The third building appears to be the cruciform plan building that is the current USAFR Center Administration Building. A small building located across Airman Drive also is observed. The immediate surrounding area is developed with large buildings and, to the west, a residential neighborhood. Some construction appears to the north.

The 1972 USGS topographic map (Figure 5, Appendix A) shows only the cruciform building and the smaller building across Airman Drive. The surrounding area has nearly 75 percent fewer buildings. The 1979 USGS topographic map (Figure 6, Appendix A) is identical to the 1972 USGS topographic map with regard to the Property.

The 1980 aerial photograph (Figure 7, Appendix A) shows the new addition on the USAFR Center and a small building appears in the southern part of the Property. The building located across Airman Drive is gone. The surrounding area appears to be unchanged from the 1972 USGS topographic map.

3.3 Past Use, Storage, Disposal, and Release of Hazardous Substances

3.3.1 Past Use and Storage of Hazardous Substances

Information related to the past use and storage of hazardous substances at the Property was compiled through review of available site records, search of federal and state environmental databases, and interviews with Army Reserve personnel. Chemicals formerly used and stored at the Property were associated with vehicle and facility maintenance activities, and janitorial services. Janitorial chemicals and building maintenance-related products were stored in the designated storage area within the janitorial closet located in the administration building.

Vehicle maintenance products and petroleum, oil, and lubricant (POL) products also were stored within designated areas within the OMS building equipped with secondary containment basins (Photograph 6, Appendix B). Other potentially hazardous materials and POL products were stored in the outdoor hazardous material storage shed (Photograph 7, Appendix B) located north of the OMS building within the MEP area. Materials used and stored in the past are similar to those used currently, which are described in Section 6.

Chemical products used and stored at the Property would have contained CERCLA hazardous.

3.3.2 Past Disposal and Release of Hazardous Substances

Information related to past disposal and potential release of hazardous substances at the Property was compiled through review of available site records, search of federal and state environmental databases, and interviews with Army Reserve personnel. According to Army Reserve personnel and site records, onsite disposal of hazardous materials or wastes has not occurred at the Property. No stained soil or stressed vegetation was observed during the site reconnaissance. The MEP area and POV parking area showed signs of minor staining from normal use. Staining was noticed around the drain at the wash rack area and on the floor of the OMS. Several large structures were present at the Property before the USAFR Center was built, as observed on aerial photographs and topographic maps. The large structures have been identified as a former Air Force Service Club; no other information about activities or other environmental concerns is available regarding these buildings.

3.4 Past Presence of Bulk Petroleum Storage Tanks

Based upon a review of available site records, a search of federal and state environmental databases, and interviews with Army Reserve personnel, three USTs were removed from the USAFR Center. An 8,000-gallon and a 2,000-gallon No. 2 fuel oil USTs were removed from the Property in November 2000, and a 1,000-gallon waste oil UST was removed in December 1992.

The 8,000- and 2,000-gallon No. 2 fuel oil USTs were removed by Nobis on November 2, 2000. The 8,000-gallon UST was removed from the east side of the Administration Building (Building 5550). When the 8,000-gallon UST was removed, the tank was observed to be in good condition with no holes or signs of corrosion. Analytical results from soil samples were non-detect for extractable petroleum hydrocarbons (EPH) or volatile petroleum hydrocarbons (VPH).

The 2,000-gallon No. 2 fuel oil UST was removed from the south side or behind the OMS (Building 5551). When the 2,000-gallon UST was removed, the tank was observed to be in good condition with no holes or signs of corrosion. Analytical results from soil were non-detect for EPH or VPH.

The 1,000-gallon waste oil UST was removed by ATEC Associates on December 3 and 4, 1991, from the east side of the OMS. When removed, the tank was in good condition with no signs of perforations or punctures, and no visible contamination was observed. The two soil samples sent to the laboratory for analysis showed levels of total petroleum hydrocarbons (TPH) of 14 parts per million (ppm) and 24 ppm.

Closure reports for the three UST removed from the Property were obtained and TPH impacts did not exceed Massachusetts Contingency Plan (MCP) minimum contaminant levels of 200 ppm for TPH. No Massachusetts Department of Environmental Protection (DEP) closure letters were obtained, and the USTs were not listed in the EDR database (Appendix E).

Several large structures previously existed on the property, and have been identified as a former Air Force Service Club; no other information is available about the type of fuel used or stored for heating of the buildings.

3.5 Review of Previous Environmental Reports

A review of site records produced several reports pertaining to the Property. The following subsections provide a brief summary of these reports. Copies of the reports, unless otherwise specified, are provided in Appendix D.

3.5.1 1992 Underground Storage Tank Closure

The report summarizes the removal of one 1,000-gallon waste oil UST by ATEC Associates in December 1992. The UST was removed from the east side of the OMS building. Soil samples collected from the bottom of the excavation showed levels of TPH of 14, 28, and 24 ppm. No stained soil was observed, the tank was intact, and groundwater was not encountered.

3.5.2 1995 Real Property Description

A historical resources inventory was prepared by The Public Archaeology Laboratory, Inc. The inventory includes historical information, setting and landscape, cultural resources, security, architectural information, and structure descriptions are included for each property. The USAFR Center has been recommended for listing on the National Register of Historic Places (NRHP).

3.5.3 1996 Natural Resources Inventory

This report inventories all the storm drains located at the USAFR Center and documents where they lead. During the site visit conducted as part of this inventory it was noted that the OWSs had visible oil layers and required maintenance and that the wash rack was full of silt. The report also inventories natural resources such as wildlife, vegetation, birds, and protected species or environments. It concluded no endangered or threatened species inhabited the Property. The report was completed by ENSR in 1996.

3.5.4 1996 Asbestos and Lead-based Paint Identification Survey

Paint and suspect potential asbestos-containing material (ACM) were collected and tested during an investigation completed in 1996. Lead was detected in the paint collected from the roof trim and exhaust fans located on the roof. ACM was not detected in six samples collected from roofing material and roof flashing. This survey was completed in response to a plan for replacement of the roof. The investigation was limited to the roof area; other interior parts of the building were not tested.

3.5.5 1998 Asbestos Survey Report and Operations and Maintenance Plan

An asbestos survey was completed in 1998 by Covino Environmental Consultants, Inc., Woburn, MA. The survey concluded that friable ACM was present in the gray mudded pipe fitting insulation and white block-type duct insulation in the sublevel mechanical room.

Nonfriable ACM included floor tiles, mastic beneath floor tiles, and black roof flashing cement.

3.5.6 1999 Storm Water Pollution Prevention Plan

This plan developed by USGS describes the stormwater drainage paths at the site. Stormwater flows from the POV parking lot and MEP toward four separate outfalls. The water discharges into the City of Chicopee stormwater municipal drains. A wash rack and several OWSs are documented as connected to the sanitary sewer. The report notes that facility personnel stated the OWSs were cleaned in 1998. Several UST locations since removed were identified in the plan.

3.5.7 2001 Underground Storage Tank Closure Report

This report prepared by Nobis Engineering Inc., Lawrence, MA, documents the removal of one 8,000-gallon UST and one 2,000-gallon UST. The 8,000-gallon UST was used to fuel the boiler in the Administration Building with No. 2 fuel oil, while the 2,000-gallon UST fueled the boiler in the OMS with No. 2 oil. Soil from around the tanks was analyzed for petroleum hydrocarbons, which were not detected. No soil staining was observed, the tank did not appear to have holes or perforations, and groundwater was not encountered.

4 Adjacent Properties

Adjacent property land uses are significant to the ECP process, as these current or past uses may have an environmental impact on the USAFR Center. Adjacent properties were included in the EDR report review for this reason. Typically, adjacent properties within 0.25 mile of the USAFR Center property boundaries are reviewed and visually surveyed. For the purposes of this ECP, the adjacent property reconnaissance was performed from the USAFR Center property boundaries and from public access points. Historical aerial photographs and topographic maps also were reviewed for conditions or activities that may have had an environmental impact on the Property.

4.1 Land Uses

The Westover Air Reserve Base (ARB) property surrounds the USAFR Center to the east, west, and south. The base exchange (BX), or base store, is located south of the Property. Military dormitories are located west of the USAFR Center, and a radar tower is adjacent to the site on the east side.

The base boundary is located north of the USAFR Center, beyond which is U.S. Department of Labor—Job Corps buildings. Also north of the USAFR Center is an oil and lube shop. The runway for the Westover ARB is located approximately 0.5 mile southeast of the USAFR Center. Table 1 summarizes the current adjacent properties, their owners, and zoning.

TABLE 1
 List of Properties Adjacent to Westover USAFR Center, Chicopee, Massachusetts

Name/Type of Property	Address	Distance and Direction from Property	Zoning	Remarks
Westover ARB—Runway and associated fueling activities	Westover ARB	Property is enclosed within Westover ARB	Military	Petroleum and solvent releases at a former DOD property
U.S. Department of Labor—Job Corps	103 Johnson Road	Approx. 685 feet north	Commercial	SHWS—40-gallon No. 4 fuel spill, permanent solution achieved
King Ward Coach Lives	70 Justin Drive	Approx. 868 feet south	Commercial	10,000-gallon diesel fuel tank; in use

SHWS—state hazardous waste site

4.2 Findings

The EDR database search results were reviewed for any evidence that adjacent properties may have past or present environmental issues that would impact the USAFR Center.

The USAFR Center is located within Westover ARB, and the EDR report has identified seven facilities within the base boundaries that have past or present environmental issues. All of these facilities have been investigated and a remediation solution has been chosen, but it is unknown whether several of them would impact the USAFR Center, based on an inferred direction of groundwater flow to the southwest. Seven additional facilities identified on the orphans list were identified as Westover ARB facilities but were unable to be located. Additionally, the U.S. Department of Labor--Job Corps was reported to have a 40-gallon diesel spill. EDR reports that a permanent solution has been found; however, soil contamination has not been brought to background levels. No information was reasonably available regarding the groundwater associated with the 40-gallon diesel spill.

Water well databases at the federal and state level were reviewed to identify any water supply source near the Property. One water supply source is located approximately 0.75 mile northeast of the Property. This water well is operated by the Massachusetts DEM State Forest and is reported as untreated and supplying 25 people.

Land use at adjacent properties does not appear to have changed significantly over the years, based on a review of available aerial photographs. Based on the 1953 topographic map, development of the Westover AFB began before 1958. After the 1970s, the number of structures on Westover AFB dramatically decreased. Since then, no major changes have occurred in the area.

5 Review of Regulatory Information

An essential component of an ECP is the review of records and databases containing information on the Property and adjacent properties. The review includes reasonably obtainable federal, state, and local government records, and is intended to identify a release or likely release of any hazardous substance or any petroleum product, which is likely to cause or contribute to a release or threatened release of any hazardous substance or any petroleum product to the Property.

The majority of the regulatory information for this ECP was obtained from EDR on September 6, 2006. EDR provides a regulatory database summary that consolidates standard federal, state, local, and tribal environmental record sources based on ASTM-recommended minimum search distances from the Property. It should be noted that the Westover ARB is a large property surrounding the USAFR Center. EDR located many of the Westover ARB facilities at the Westover ARB main gate. However, in reality, many of these "main gate" facilities are situated further north and east, and therefore possibly upgradient from the USAFR Center.

All findings reported in Sections 5.1, 5.2, and 5.3 are from the EDR report unless otherwise noted. A copy of the complete EDR report is included in Appendix E.

5.1 Federal Environmental Records

5.1.1 Federal National Priorities List Sites within 1 Mile

USEPA maintains a record of the nation's worst uncontrolled or abandoned hazardous waste sites, known as the National Priorities List (NPL). Sites on the NPL undergo long-term remedial action under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The USAFR Center is not an NPL site, nor were any such sites located within 1 mile of the Property.

5.1.2 Federal Comprehensive Environmental Response, Compensation and Liability Act Information Systems Sites within 0.5 Mile

The CERCLA Information System (CERCLIS) contains data on potentially hazardous waste sites that have been reported to USEPA by state, municipalities, private companies, and private persons, pursuant to Section 103 of the CERCLA. CERCLIS contains sites that either are proposed to be or are on the NPL and sites that are in the screening and assessment phase for possible inclusion on the NPL.

The Westover USAFR Center is not a CERCLIS site, and there are no CERCLIS sites located within 0.5 mile of the center.

5.1.3 Resource Conservation and Recovery Act Corrective Action Sites Within 1 Mile

Resource Conservation and Recovery Act (RCRA) corrective action sites (CORRACTS) represent facilities that have generated or managed hazardous wastes and require corrective action. The USAFR Center is not a CORRACTS site, nor were any such sites identified within 1 mile of the USAFR Center.

5.1.4 RCRA Transport, Treatment, and/or Disposal Sites Within 0.5 Mile

RCRA defines and regulates sites that generate, transport, treat, store, and/or dispose (TSD) of hazardous wastes. The RCRA Information System (RCRIS) includes selective information on these sites.

The USAFR Center is not a RCRIS-TSD site and there are no such sites located with 0.5 mile of the USAFR Center.

5.1.5 Federal RCRA Small and Large Quantity Generators List within 0.25 Mile

Conditionally exempt small quantity generators are defined as facilities generating less than 100 kilograms (kg) of hazardous waste, or less than 1 kg of acutely hazardous waste per month. RCRA small quantity generators are defined as facilities generating between 100 and 1,000 kg of hazardous waste per month. A facility generating more than 1,000 kg of hazardous waste or over 1 kg of acutely hazardous waste per month is defined as a large quantity generator.

The USAFR Center is not a RCRA-registered small or large quantity generator, nor are there any such sites within 0.25 mile of the site.

5.1.6 Department of Defense

The DoD consists of federally owned or administered lands, administered by the DoD that have an area equal to or greater that 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands. The USAFR Center was part of the former Westover AFB.

5.1.7 Formerly Used Defense Sites

The listing includes locations of formerly used defense site (FUDS) properties where USACE is actively working or will take necessary cleanup actions.

The USAFR Center was not identified on the FUDS list. Two sites identified on the FUDS list are approximately 15.1 acres of the formerly used bulk POL terminal area and a 2.8-acre salvage yard. Neither of these areas are upgradient from the USAFR Center, assuming the inferred flow direction to the southwest.

5.1.8 Federal Emergency Response Notification System List

The federal Emergency Response Notification System (ERNS) List maintains information on reported releases of oil and hazardous substances. The USAFR Center is not on this notification list.

5.2 State and Local Environmental Records

Most of the information presented in this subsection was obtained from the EDR report. Additional information also was obtained from online database searches of the State of Massachusetts Web site. Occasionally, state and local agency personnel were interviewed via telephone to answer questions about any database issues.

5.2.1 State Lists of Hazardous Waste Sites within 1 Mile

The USAFR Center is not listed as a state hazardous waste site (SHWS). Within 1 mile of the USAFR Center were 17 adjacent properties listed as having a hazardous waste site (Table 2).

TABLE 2
 State-Registered Hazardous Waste Sites
 Near Westover USAFR Center, Chicopee, Massachusetts

Company/Site	Address	Distance and Direction from Property	Regulatory Status	Elevation Relative to Property
U.S. Department of Labor—Job Corps	103 Johnson	685 feet north-northeast	RAO—40-gal No. 4 fuel oil spill has not been reduced to background	Equal/higher
Off Westover Road	32 Dulong CIR	1,565 feet south	RAO—Class C (no health risk) for 28700 ppb TCE	Equal/higher
Stop & Shop Warehouse and Distribution Center	1255 Sheridan Street	2,305 feet southeast	RAO—contaminants reduced to background	Equal/ higher
Building 3155—Westover AFB	Seawolf Avenue, Westover ARB	2,637 feet southeast	RAO—permanent solution, not reduced to background	Equal/higher
Westover Hangar Apron/Aqua sys	Westover AFB	2,656 feet southeast	RAO—partial outcome, not reduced to background	Equal/higher
Vehicle Maintenance Shop	Westover AFB	2,656 feet southeast	RAO—contaminants reduced to background	Equal/higher
No Location Aid	1380 Sheriden Street	2,819 feet east	RAO—no significant risk	Equal/ higher
Hangar 11	227 Lonczak Dr.	3,733 feet south-southeast	RAO—contaminants reduced to background	Equal/higher
WAFB Building # 9000	Access Road	3,779 feet northwest	RAO—permanent solution, not reduced to background	Equal/higher
Echo-2 Tarmac – Westover AFB	250 Patriot Avenue	3,892 feet east-northeast	RAO—permanent solution, not reduced to background	Equal/higher
Avery Dennison Company	1 Better way	5,262 feet east-northeast	RAO—contaminants reduced to background	Equal/higher
Hess Station 21209	1423 Memorial Drive	4,463 feet west-northwest	RAO—permanent solution, not reduced to background	lower
Fairview Plaza	1451-1505 Memorial Drive	4,485 feet west-northwest	RAO—no significant risk	lower
Dairy Mart	1284 Memorial Drive	1,401 feet west	RAO—release of unknown chemicals	lower

RAO = Response Action Outcome, a site has been assessed and a remedial action as been put in place.

5.2.2 State-Registered Landfills or Solid Waste Disposal Sites within 0.5 Mile

The USAFR Center does not have a solid waste landfill, incinerator, or transfer station within the Property boundaries. No adjacent properties within 0.5 mile of the USAFR Center have a solid waste landfill, incinerator, or transfer station.

5.2.3 State-Registered Leaking UST Sites within 0.5 Mile

In addition to information obtained from the EDR report, the Massachusetts Division of Underground Storage Tanks maintains a comprehensive database of leaking underground storage tank (LUST) sites. The USAFR Center is not listed in the state LUST database. There are no LUST sites listed on the database within 0.5 mile of the USAFR Center.

5.2.4 State-Registered UST Sites within 0.5 Mile

Based on a review of the EDR report and the state of Massachusetts UST database, one UST site was identified within 0.5 mile of the USAFR Center. The Property itself was not listed in the state UST database. The UST site was identified as King Ward Coach Lives, 70 Justin Drive. A 1,000-gallon diesel UST has an approved in-tank monitor.

5.2.5 Massachusetts Release Tracking Database within 1 Mile

The USAFR Center is not listed on Massachusetts state release tracking database. There are 22 release sites within 1 mile of the USAFR Center (Table 3).

5.2.6 Records of Contaminated Public Wells within 1 Mile

A search of federal and state water well databases within 1 mile of the USAFR Center identified one public water supply source located approximately 0.75 mile northeast of the Property. The well is owned by the Massachusetts DEM State Forest and is an untreated well that has not had major violations or enforcement.

TABLE 3
 Massachusetts Release Tracking Database
Near Westover USAFR Center, Chicopee, Massachusetts

Company/Site	Address	Distance and Direction from Property	Regulatory Status	Elevation Relative to Property
U.S. Department of Labor—Job Corps	103 Johnson	685 feet north-northeast	RAO—40-gallon No. 4 fuel oil spill has not been reduced to background	Equal/higher
Off Westover Road	32 Dulong CIR	1,565 feet south	RAO—Class C (no health risk) for 28,700 ppb TCE	Equal/higher
Stop & Shop Warehouse and Distribution Center	1255 Sheridan Street	2,305 feet southeast	RAO—contaminants reduced to background	Equal/ higher
Building 3155—Westover AFB	Seawolf Avenue, Westover ARB	2,637 feet southeast	RAO—permanent solution, not reduced to background	Equal/higher
Westover Hangar Apron/Aqua sys	Westover AFB	2,656 feet southeast	RAO—partial outcome, not reduced to background	Equal/higher

TABLE 3
 Massachusetts Release Tracking Database
Near Westover USAFR Center, Chicopee, Massachusetts

Company/Site	Address	Distance and Direction from Property	Regulatory Status	Elevation Relative to Property
Vehicle Maintenance Shop	Westover AFB	2,656 feet southeast	RAO—contaminants reduced to background	Equal/higher
No Location Aid	1380 Sheridan Street	2,819 feet east	RAO—no significant risk	Equal/ higher
Hangar 11	227 Lonczak Drive	3,733 feet south-southeast	RAO—contaminants reduced to background	Equal/higher
WAFB Building # 9000*	Access Road	3,779 feet northwest	RAO—permanent solution, not reduced to background	Equal/higher
Echo-2 Tarmac – Westover AFB	250 Patriot Avenue	3,892 feet northwest	RAO—permanent solution, not reduced to background	Equal/higher
Avery Dennison Company	1 Better Way	5,262 feet east-northeast	RAO—contaminants reduced to background	Equal/higher
No Location Aid	1737 Donohue Road	4,914 feet east-northeast	RAO—permanent solution not reduced to background	Equal/higher

Fairview Plaza	1451-1505 Memorial Drive	4,485 feet west-northwest	RAO—no significant risk	lower
Dairy Mart	1284 Memorial Drive	1,401 feet west-northwest	RAO—release of unknown chemical	lower
Fairview Service Center Inc.	1492 Memorial Drive	4,580 feet west	Completion statement received	lower

RAO = Response Action Outcome—(permanent solution not reduced to background)—a facility that has addressed contamination but that the contamination has not necessarily been cleaned up.

5.3 Unmapped Sites

Some sites within the databases EDR searches have the same zip code as the USAFR Center, but no street address. These sites, known as unmapped or orphan sites, cannot be mapped from the EDR results alone. Additional efforts described herein were made to locate these sites and assess their environmental importance to the USAFR Center.

Using the mapping utility provided at maps.google.com, and mapquest.com the locations of the orphan sites were identified and mapped. Many of the orphan sites were identified as Westover ARB target with no addresses. These are listed below:

- WARB Jet Test Stand Area – SHWS, Release
- New Industrial Security Gate D – SHWS, Release
- Building 1833 – SHWS, Release

5.4 Summary of Properties Evaluated to Determine Risk to the Property

To summarize Subsections 5.1 through 5.3, separate properties, near or adjacent to the USAFR Center, were evaluated as potential risk properties to the Property. These adjacent properties evaluated were identified as a result of information obtained during area reconnaissance, interviews, and regulatory database searches. Those determined to pose a potential risk to the Property are summarized below in Table 4.

TABLE 4
 Properties Evaluated for Potential Environmental Risks
Westover USAFR Center, Chicopee, Massachusetts

Company/Site	Address	Distance, Direction Relative to Property?	Potential Impact on the Property?	Comments
Westover ARB—runway and associated fueling activities	Westover ARB, several orphan sites with unknown locations	Within Westover ARB	Unknown	Petroleum and solvent releases; remediation ongoing Inferred to be downgradient from the Property
U.S. Department of Labor—Job Corps	103 Johnson Road	Approx. 685 feet north	Upgradient, possible impacts	SHWS—40-gallon No. 4 fuel spill, permanent solution achieved
Off Westover Road	32 Dulong Circle	1,565 feet south	RAO—Class C (no health risk) for 28,700 ppb TCE; other side of a brook	Equal/higher
Westover Hangar Apron/Aqua sys	Westover AFB	2,656 feet southeast	RAO—partial outcome, not reduced to background; possible impacts	Equal/higher
Building 3155—Westover AFB	Seawolf Avenue, Westover ARB	2,637 feet southeast	RAO—permanent solution, not reduced to background; possible impacts	Equal/higher
WAFB Building 9000	Access Road	3,779 feet northwest	RAO—permanent solution, not reduced to background; possible impacts	Equal/higher

6 Site Investigation and Review of Hazards

Findings documented in the following subsections are based on the September 6, 2006, site reconnaissance, a review of available site records, and information obtained from U.S. Army Reserve personnel.

6.1 USTs/ASTs

An 8,000-gallon No 2 fuel oil UST was removed from the east side of the Administration Building (Building 5550) in 2000 by Nobis. When the 8,000-gallon UST was removed, the tank was observed to be in good condition with no holes or signs of corrosion. Analytical results from soil samples were non-detect for EPH or VPH.

A 2,000-gallon No. 2 fuel oil UST was removed from the south side or behind the OMS (Building 5551) in 2000 by Nobis. When the 2,000-gallon UST was removed, the tank was observed to be in good condition with no holes or signs of corrosion. Analytical results from soil samples were non-detect for EPH or VPH.

The 1,000-gallon waste oil UST was removed by ATEC Associates on December 3 and 4, 1991, from the east side of the OMS. When removed, the tank was in good condition with no signs of perforations or punctures, and no visible contamination was observed. The two soil samples sent to the laboratory for analysis showed levels of TPH of 14 and 24 ppm.

Closure reports for the three UST removed from the Property were obtained and TPH impacts did not exceed MCP minimum contaminant levels of 200 ppm for TPH. No Massachusetts DEP closure letters were obtained, and the USTs were not listed in the EDR database (Appendix E).

6.2 Inventory of Chemicals/Hazardous Substances

Records pertaining to hazardous substances including hazardous materials, chemical bulk storage, petroleum products, hazardous waste, and petroleum waste were reviewed in addition to interviews and the site reconnaissance to develop the inventory for this Property.

Available records indicate that hazardous materials or POLs have been stored at this facility in conjunction with intermittent use of the OMS facility. Materials stored at the site historically included waste oils, solvents, antifreeze, and other fluids associated with vehicle maintenance.

During the site reconnaissance cleaning solvents, waxes, and other cleaning products were observed in the janitor's closet. A hazardous material storage shed was observed in the parking lot, north of the OMS building. Motor oil, No. 2 fuel waste oil, diesel fuel, solvents, glycol, hydraulic fluid, lube engine oil, paint, brake fluid, base/acid used to combat nuclear biological, and/or chemical (NBC) attack, and several batteries were observed in the hazardous material storage shed. According to site contacts, the OMS produces

approximately one 55-gallon drum of waste oil every 4 years from light maintenance of vehicles. Once the drum is filled, the unit removes the waste within 90 days via the Defense Reutilization and Marketing Office.

According to personnel from the 287th Medical Dental Unit, this dental unit is a mobile unit and does not perform dentistry operations at the facility. During the site reconnaissance, waxes and solvents were seen, but no X-ray or radiological material was observed.

Current tenants use a licensed commercial company (Burns & Roe) for herbicide and pesticide management. Other than the assumed routine household and yard use of pesticides and herbicides, no evidence of pesticide/herbicide use (empty containers, dead or stressed vegetation) was observed during the site reconnaissance.

6.3 Waste Disposal Sites

Available records and interviews did not indicate the practice of onsite waste disposal. No waste disposal sites were observed during the site reconnaissance, nor were any signs of past onsite waste disposal (such as stressed vegetation or suspicious depressions in the landscape) observed.

6.4 Pits, Sumps, Drywells, and Catch Basins

Available records, interviews, and site observations did not indicate the existence or past existence of any pits, drywells.

Several stormwater basins were observed on the Property, and according to the Storm Water Pollution Prevention Plan (USGS, 1999), the water is diverted from the MEP and POV parking lots toward four outfall points. The first outfall point collects runoff from within MEP 1 and directs stormwater southwest along Galaxy Road, eventually discharging to Williams Brook. Outfalls two and three collect runoff from the area in front of the OMS building and the southern edges of the POV parking area, respectively. These two outfalls discharge to the storm sewer on Airman Drive, which flows southwest towards Galaxy Drive and ends up in Williams Brook. The fourth outfall point collects runoff from the northern side of the POV parking lot and discharges to the storm sewer system that flows west to Williams Brook.

According to a drain survey, 12 floor drains located at the Property are connected to the sanitary sewer. Of these, the flow from the four drains located in the OMS and the drains from the wash rack first passes through the three OWSs before discharging to the sanitary sewer. Within the Administrative Building, two drains located in the kitchen direct flow through an outdoor grease trap (Photograph 8, Appendix B) prior to discharge to the sanitary sewer. Drains located in the boiler room and four drains located in and around the air handling room are connected directly to the sewer (Photograph 9, Appendix B).

According to personnel present during the site reconnaissance, the OWSs are maintained regularly. The SWPPP indicates the OWSs were serviced at least in 1998. This inspection report and any other inspection records were not available for review. One OWS is adjacent to the wash rack on its east side. The other two OWSs are located on the south side of the

OMS building (Figure 7, Appendix B). These OWSs have manhole covers and associated sampling ports. During the site reconnaissance, an oil stain was observed directly around the wash rack area drain (Figure 2, Appendix B). The concentrated nature of this stain directly around the drain appeared to be indicative of a spill or discharge from a vehicle. Facility personnel were not aware of any spills at the wash rack area.

A former hydraulic pit was observed in the OMS shop (Photograph 3, Appendix B). This pit is about 1 foot wide and runs 12 to 15 feet and approximately 12 feet deep. According to personnel at the site, the pit has been unused for many years and was used originally to lift military vehicles when they required maintenance. An associated hydraulic pump is located in this bay, presumably to operate the hydraulic lift. Site personnel stated that the pump is dry and has not been operated as long as personnel can remember. Although the hydraulic pit is not currently used, the bay is reportedly still used for routine maintenance. According to personnel at the site 55 gallons of POL waste is generated from routine maintenance at the OMS per year. Staining was observed on the metal plate covering the pit and on the floor of the OMS, and along the sidewalls of the pit (Photograph 10, Appendix B). While it was difficult to see the pit bottom, due to the depth of the pit, there did not appear to be any staining in the bottom of the pit (see Photograph 11, Appendix B).

6.5 Asbestos-Containing Material (ACM)

Friable and nonfriable ACM were identified on the Property. Roof materials were identified as ACM (Dames & Moore, 1996), and a later report identified friable mudded piping insulation and block-type insulation in the sublevel mechanical room. Nonfriable ACM includes floor tiles and underlying mastic adhesives beneath floor tiles and black roof flashing cement (CEC, 1998). No other records were available indicating whether abatement has been performed.

6.6 PCB-containing Equipment

One pole-mounted transformer is located on the Property, between the Administration Building and the OMS (Photograph 10, Appendix B). No staining or leaks were observed beneath the transformer. The transformers were observed to be in good condition and are not considered a recognized environmental condition. No labels were observed on the transformer.

6.7 Lead-Based Paint

An LBP survey was conducted for the Army in conjunction with an asbestos survey in 1996 included this facility. Samples were collected from the Property, and it was determined that LBP was determined to be present located on the roof flashing and a fan. The LBP survey was completed in preparation for replacement of the roof at which time all LBP identified was removed. The investigation was limited to the roof and interior spaces were not inspected during this investigation.

6.8 Radon

A site-specific radon survey was conducted at the USAFR Center in 1994. Passive detection equipment was installed in two locations, the first in the basement of the administration building and the second location is in the OMS building. Sampling results from the administration building were 1.3 picoCuries per liter (pCi/L), while results from the OMS building were 0.7 pCi/L. These levels were below the action level of 4 pCi/L.

6.9 Munitions and Explosives of Concern (MEC)

Based on a review of available records, the site reconnaissance, and interviews with USAFR Center personnel, there are no indications that unexploded ordnance is or was present at the Property. There are no firing ranges on the Property, and there is no evidence that a firing range existed on the Property historically. A weapons vault was observed in a building, although no ammunition currently or historically was stored in the vault.

6.10 Radioactive Materials

Based on a review of available records, the site reconnaissance, and interviews with USAFR Center personnel, small amounts of radioactive devices such as radioactive compasses, gas and chemical detection devices, and night vision goggles are stored onsite. Both the Army and Marine Corps have store rooms with these radioactive pieces of equipment. The amount of radioactive materials present in these devices is expected to be de minimis and, therefore, is not expected to present a threat of release to the environment.

7 Review of Special Resources

7.1 Land Use

The USAFR Center and surrounding Westover ARB are federal lands zoned for military purposes.

7.2 Coastal Zone Management

The Massachusetts Office of Coastal Zone Management is the lead agency for the Massachusetts Coastal Management Program. This Property is not included in the coastal zone management plan, nor is it in a coastal zone.

7.3 Wetlands

According to the U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory map, no wetlands appear on the USAFR Center property, and no wetlands appear within 0.25 mile of the USAFR Center. Several riverine wetlands appear east of the airport runway associated with Cooley Brook. Several other areas north of the USAFR Center appear to be associated with a lake. The Natural Resources Survey did not mention any wetlands located on the property.

7.4 100-year Floodplain

A review of the FEMA digital Flood Hazard Area map indicates that the Property lies outside the 100-year floodplain. No areas within 1 mile of the USAFR Center lie within the 100-year floodplain.

7.5 Natural Resources

A natural resources survey completed by ENSR (1994) noted that this USAFR Center does contain upland vegetation consisting of trees shrubs, grasses, and forbs. Approximately 50 to 100 oaks were identified on the Property as commercially valuable. The Property otherwise does not contain any key natural resources, including wetlands, surface water, floodplains, rare species, and/or the potential for rare species. Appendix D contains copies of the natural resource survey report.

7.6 Cultural Resources

The USAFR Center has been evaluated as a contributing resource to a potential Westover AFB National Register historic district. Attached in Appendix D is the Massachusetts Historical Commission evaluation prepared by The Public Archaeology Laboratory, Inc. The USAFR Center has been recommended for listing on the NRHP. The Massachusetts Historical Commission found Westover AFB eligible for the NRHP in November 1995.

An archaeological sensitivity study was completed for this facility coming to the conclusion that the Site has low probability of intact archeological resources (PAL Inc. 1995).

8 Conclusions

The following information was obtained after conducting an environmental record search, including records for adjacent properties, reviewing available historical information, conducting interviews with knowledgeable parties connected with the Property or with state and local agencies, and conducting a reconnaissance of the Property and adjacent properties.

8.1 Review of Findings

Hazardous Substances. Hazardous substances pursuant to CERCLA 101(14) (42 USC 9601 (14)) were used and stored at the Property in amounts necessary to support unit-level vehicle and building maintenance activities.

At the time of the site reconnaissance, an oil stain was observed over the wash rack area drain, which flows to an OWS. The OWS leads to the sanitary sewer, therefore, it is unlikely the spilled or leaked material impacted environmental media.

There is no evidence that a release of hazardous substances to the environment has occurred as a result of USAFR activities at the Property.

USTs/Aboveground Storage Tanks (ASTs). Three USTs were removed from the USAFR Center. An 8,000-gallon No. 2 fuel oil UST was removed from the east side of the Administration Building (Building 5550) in 2000. A 2,000-gallon No. 2 fuel oil UST was removed from the south side or behind the OMS (Building 5551) in 2000. A 1,000-gallon waste oil UST was removed in 1991 from the east side of the OMS. According to closure records, soil samples did not exceed soil contaminant criteria for petroleum.

Non-UST/AST Petroleum Storage. Petroleum storage other than in USTs or ASTs was not observed on the Property.

Polychlorinated Biphenyls (PCBs). One pole-mounted transformer is located on the Property, between the Administration Building and the OMS. No labels were observed on the transformer to indicate whether it contains PCBs. No staining or leaks were observed beneath the transformer. It is unknown whether the transformer contains PCBs but it was observed to be intact and is therefore not considered a recognized environmental condition or concern.

Asbestos Containing Materials (ACM). A 1998 asbestos survey evaluation at the USAFR Center found friable and nonfriable types of ACM. Friable mudded piping insulation and block-type insulation were noted in the sublevel mechanical room. Nonfriable ACM includes floor tiles and underlying mastic adhesives beneath floor tiles and black roof flashing cement. There are no records indicating whether abatement was performed.

LBP. A limited LBP survey was conducted in 1996 at the USAFR Center. Samples were collected from the roof and associated areas in preparation for a roof replacement. It was determined that LBP was present in paint collected from roof flashing and a fan (Dames &

Moore, 1996). During the roof replacement, the LBP was removed from the Property. The interior spaces were not evaluated for LBP during this investigation. At the time of the ECP site reconnaissance, some painted surfaces, especially in the bathrooms, had chipping or peeling paint. No peeling paint was observed on exterior painted surfaces.

Radiological Materials. Based on a review of available records, the site reconnaissance, and interviews with USAFR Center personnel, there are radioactive materials currently stored at the USAFR Center. Property personnel indicated that radioactive devices such as radioactive compasses, gas and chemical detection devices, and night vision goggles are stored at the Property for use in training exercises. Both the Army and Marine Corps have store rooms with this radioactive equipment. The amount of radioactive material present in these devices is expected to be de minimis and, therefore, is not expected to present a threat of release to the environment.

Radon. A site-specific radon survey was conducted at the USAFR Center in 1994. Passive detection equipment was installed in two locations, the first in the basement of the administration building and the second location is in the OMS building. Sampling results from the administration building were 1.3 picoCuries per liter of air (pCi/L) while results from the OMS building were 0.7 pCi/L. These results were below the action level of 4 pCi/L.

Munitions and Explosives. Available records do not indicate any munitions and explosives of concern (MEC) currently or formerly located at this Property. No evidence of MEC was observed during the site reconnaissance. A weapons vault was observed in a building, although no ammunition currently or historically was stored in the vault.

Surrounding Properties. Potential environmental sites of concern, located within the ASTM D6008 recommended minimum search distances from the Property, were evaluated through database review and site reconnaissance. Many of the former Westover AFB sites were unable to be located and were placed on the orphan summary. Although groundwater flow in the area of the Westover ARB is uncertain, several of the properties for which specific data were available exhibited environmental conditions had or have the potential to adversely affect environmental conditions at the Property.

Wetlands and Floodplain. According to the USFWS National Wetlands Inventory map, no wetlands appear on the USAFR Center property or within 0.5 mile of the Property. The Property is not located within a 100-year floodplain or within a coastal zone. The Natural Resources Survey did not mention any wetlands located on the property.

Threatened and Endangered Species. A natural resources survey noted that this USAFR Center does contain upland vegetation consisting of trees shrubs, grasses, and forbs. Roughly 50 to 100 oaks were identified on the Property as commercially valuable. The Property otherwise does not contain any key natural resources, including wetlands, surface water, floodplains, rare species, and/or the potential for rare species.

Archaeological and Historical Resources. The Massachusetts Historical Commission found Westover AFB eligible for the NRHP in November 1995. Attached in Appendix D is the Massachusetts Historical Commission evaluation prepared by The Public Archaeology Laboratory, Inc. The USAFR Center has been recommended for listing on the NRHP. An archaeological sensitivity study was not completed for this report. Historical topographic

map uncovered several structures previously located on the property associated with an Air Force service Club. No other environmental information is known about the previous structures.

8.2 Environmental Condition of Property

Findings of this ECP report were based on reasonably available environmental information; interviews with site, state, and local personnel; review of previous environmental studies; and federal and state database and file information related to the storage, release, treatment, or disposal of hazardous substances or petroleum products. Results also were based on visual observations of the Property and adjacent properties.

In accordance with the DoD policy defining the classifications (see Sherri Goodman Memorandum dated 21 October 1996), the Property has been classified into one of seven property types. Based on the results of this ECP study, the property has been assigned an overall DoD Environmental Condition Type 7. The property type is based on the following major findings.

- Subsurface environmental conditions on the Westover ARB that have significant potential to impact the USAFR Center.

RECORD OF ENVIRONMENTAL CONSIDERATION (REC)
94th Regional Support Command

Proposed Action Location: Westover AFRC, 160 Airman Drive, Chicopee, MA

Title of Proposed Action: Transfer of portion (split stationing) of 303rd Postal Company to Westover AFRC.

Description of Proposed Action: To split station the 303rd postal Company to allow a small detachment to perform administrative duties at the Westover AFRC. This proposed use is entirely in keeping with the relevant facilities, to include parking, sewerage, etc. Should this unit actually handle mail at this facility, unit members should be trained and equipped to respond properly to packages and letters that may pose environmental or public health threats.

Dates of Proposed Action: Fall 2003 for an indefinite time

Determination: Based on a review of all known aspects of this proposal, it is determined that this project does not require an Environmental Assessment according to AR 200-2 as published in 32 CFR Part 651, 29 March 2002. Furthermore, proposed action is categorically excluded under AR 200-2, Appendix B (32 CFR 651, Appendix B to Part 651-Categorical Exclusions), having no significant individual or cumulative environmental impacts.

Categorical Exclusion: B-12

Any change in the scope, location or timing of this project will require re-evaluation and possible additional documentation by the proponent with the 94th RRC Environmental Division.

MEMORANDUM FOR RECORD

SUBJECT: 303rd AG CO (Postal) Relocation Market Supportability Study

1. A Market Supportability Study is not required for the relocation of the 303rd AG CO (Postal) from Ayer, MA to Chicopee, MA. There is no requirement for the study based on the size of the unit (Assigned Strength – 19) and the fact that the unit will be back-filled by soldiers caused by the relocation of the 470th AG CO from Springfield, MA to the 63rd RRC in California.

2. POC for this HQ is Mr. Michael Stylianos at 978-784-3662 or MAJ Kurt O'Rourke at 978 784-3657.

MEMORANDUM FOR The Adjutant General of Massachusetts, ATTN: The Adjutant General's Office, 50 Maple Street, Milford, Massachusetts 01757-3604

SUBJECT: Reorganization/Relocation of one Postal Services Platoon of the 303rd Adjutant General Company (Postal)

1. Purpose. In accordance with DOD Directive 1225.7, *Reserve Component Facilities Programs and Unit Stationing*, this memorandum provides notification of the proposed stationing action to the State Adjutant General.

1. Discussion. This headquarters is preparing a stationing packet for the proposed split-stationing relocation of one Postal Services Platoon of the 303rd Adjutant General Company of Ayer, MA from Ayer, MA to Westover AFB, Chicopee, MA. This unit is programmed as a backfill for the 470th Adjutant General Company (Postal), which is relocating to California in FY04. The 470th has a current structured strength in Springfield of 4/0/37/41. The structured strength of one Postal Services Platoon of the 303rd Adjutant General Company (Postal) is 1/0/18/19 for a decrease in requirements of 22 pax in the Springfield area.

3. Details. The following information is provided regarding unit **type**

- SRC: 12440L20000100
- MTOE: 12440LAR07 AR0104
- Required Strength of 303rd (OFF/WO/ENL/AGG): 5/0/54/59

4. Action. Request that you provide comments on this **proposed** stationing action by 30 October 03. Failure to reply by this date will be noted as a negative response in the relocation **packet**.

5. Closure. For additional information, contact **Mr. Michael Stylianos**, Supervisory Management Analyst, at 978-784-3662, or e-mail michael.stylianos@usarc-emh2.army.mil.

DAKFI

Ms. Castriotta:

Attached is a report by ATEC Associates, Inc. (ATEC), detailing the closure of one Underground Storage Tank (UST) referenced as UST No. 0070, located at the United States Army Reserve Center, Building 5550, Westover AFB, Chicopee, Massachusetts (the site). The Technical Report covers work conducted under Contract No. DAKF31-91-D-0015 as part of Removal of Underground Storage Tanks in the New England Area, US Army Project No. EQ-19027-9P.

ATEC appreciates the opportunity to be of service in this matter. If you have any questions or comments, please do not hesitate to contact our office.

Sincerely,

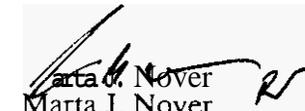

ATEC Associates, Inc.

ATEC Project No. 37.04.483

1.0 INTRODUCTION

This Technical Report details the removal of one Underground Storage *Tank* (UST) referenced as UST No 0070 at the United States Army Reserve Center, Building 5550, Westover AFB, Chicopee, Massachusetts (the site). **This** Technical Report covers work conducted under Contract No. DAKF31-91-D-00115 as part of Removal of Underground Storage Tanks in the New England Area, US Army Project No. EQ-19027-9P.

The basic Project Work Scope included:

- Procurement/administration of all federal, state and local permits, manifests, regulations, etc., associated with UST system closure.
- Excavating, venting, cleaning, transporting, and disposing of one 1,000 gallon UST by appropriately licensed contractors/facilities.
- Disposal of residual UST materials at a licensed facility.
- Field screening and analysis of soil from the excavations by Photoionization Detector (PID) and field analyzed with a portable Non-Dispersive Infrared (**NDIR**) Analyzer, to identify evidence of a release of oil and hazardous materials from the UST, if any.

Laboratory Analysis of soil sampled from the UST excavation by a USEPA certified laboratory for Total Petroleum Hydrocarbons (USEPA Method 418.1).

- Backfill and surface restoration.
- Preparation of a Technical Report, to include assimilation of information gathered, major findings and conclusions.

2.0 POST REMOVAL REPORT

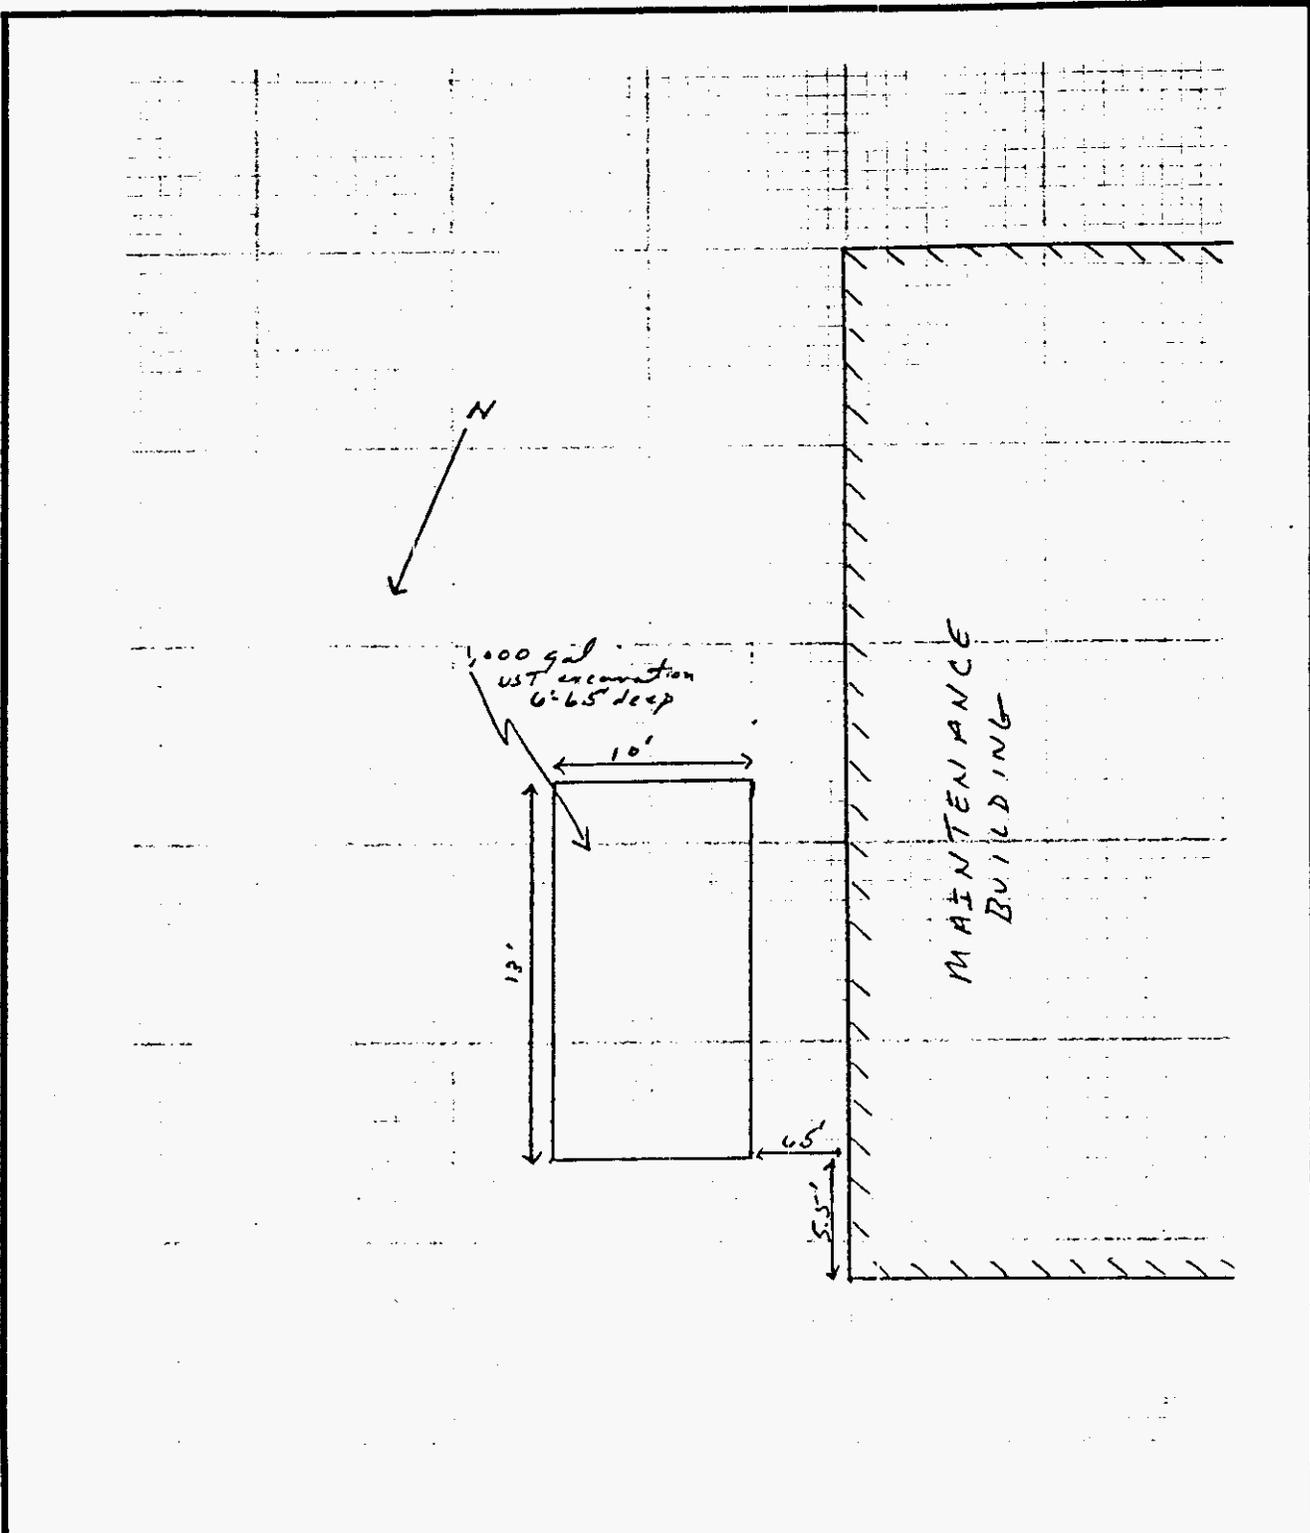

2.1 Subsurface Storage Tank Excavation and Removal

On December 3 and 4, 1991, one 1,000 gallon, subsurface, waste oil, storage tank was excavated and removed from the site. The UST was located near the northwest corner of the maintenance building. Site topography is sloped moderately upgradient to the north, and relatively level to the south.

The tank was observed to be in good condition with no signs of perforations or punctures. The tank was covered by approximately two feet of soil.

Native soils in the excavation consisted primarily of medium brown, fine silty sand with little fine to medium gravel. The bottom of the excavation was approximately six to seven feet below grade. Groundwater was not encountered in the excavation. No visible contamination of soil was observed.

Associated piping was drained, and tank connections were removed. UST No. 0070 was estimated to contain 160 gallons of waste oil and halogenated solvents. One sample of the tank contents (W.O.) was laboratory analyzed for disposal classification purposes. The analytical results are in Appendix D. The waste oil was removed on December 3 and 4, 1991 and drummed for on-site storage. The waste oil was transported to Pollution Solutions of Williston, Vermont on July 6, 1992, by Lincoln Environmental, Inc. Tank openings were capped, and the tank was removed from the excavation. The tank was

UST LOCATION PLAN
 1,000 gallon UST relative to maintenance building at:
 US Army Reserve Center
 Chicopee, Massachusetts

PROJECT: 37.07.483
 NOT TO SCALE
 FIGURE: 2

observed to be in good condition with no perforations or punctures. Following venting of the tank, an access way was cut in the end of the tank to allow entry for cleaning. It was then entered and vacuumed/wiped clean of any resided materials.

The scrap tank was removed from the site on December 4, 1991 and disposed at Mass Tank Disposal, a licensed Massachusetts tank yard located in Chicopee, Massachusetts.

2.2 Sampling and Analysis Plan

Ten soil samples were obtained from the excavation for field screening with a Photoionization Detector (PID) and field analyzed with a Non-Dispersive Infrared (NDIR) Analyzer. The PID field screening for Total Organic Vapors (TOV) were conducted with an HNu photoionizer utilizing the jar headspace screening procedures outlined in the Hazardous Materials Containment Plan. The NDIR field screening for Total Petroleum Hydrocarbons (TPH) was conducted with a Horiba OCMA 220, utilizing the procedures outlined in the Hazardous Materials Containment Plan.

Eight of the samples (SS-1 to **SS-8**) were obtained from the excavation walls at a depth of approximately three to four feet below grade. Two of the samples (SS-9 and SS-10) were obtained from the bottom of the excavation at a depth of approximately **six** to seven feet below grade. Sampling locations for the excavation are depicted on the Sampling Schematic attached as Figure 2.

Two soil samples (Stock-I and Stock-2) from the stockpile were obtained pursuant to the Hazardous Waste Containment Plan for screening with a Photoionization Detector (PID) and Non-Dispersive Infrared Analyzer (NDIR). PID readings revealed 0 ppm. **NDIR** readings revealed **34.2** ppm TPH for Stock-I. Stock-2 was broken during shipping, therefore, it was not analyzed using the **NDIR**.

Two soil samples (LSS-1 & LSS-2) were obtained from the excavation for laboratory analysis. One composite soil sample LSS-3 was obtained from stockpiled soil for laboratory analysis. These samples were analyzed for TPH utilizing USEPA Method 418.1.

A sample of the **tank** (w.o.) contents was laboratory analyzed for disposal classification purposes. Laboratory analyses included Volatile Organic Compounds (USEPA Method 8010/8020), Semi - Volatile Organic Compounds (USEPA Method 8270), 13 Metals by Toxicity Characteristic Leaching Procedure (USEPA Method 6010), Polychlorinated Biphenyls (USEPA Method 8080), Corrosivity (USEPA Method 9045), and Ignitability (USEPA Method 1010).

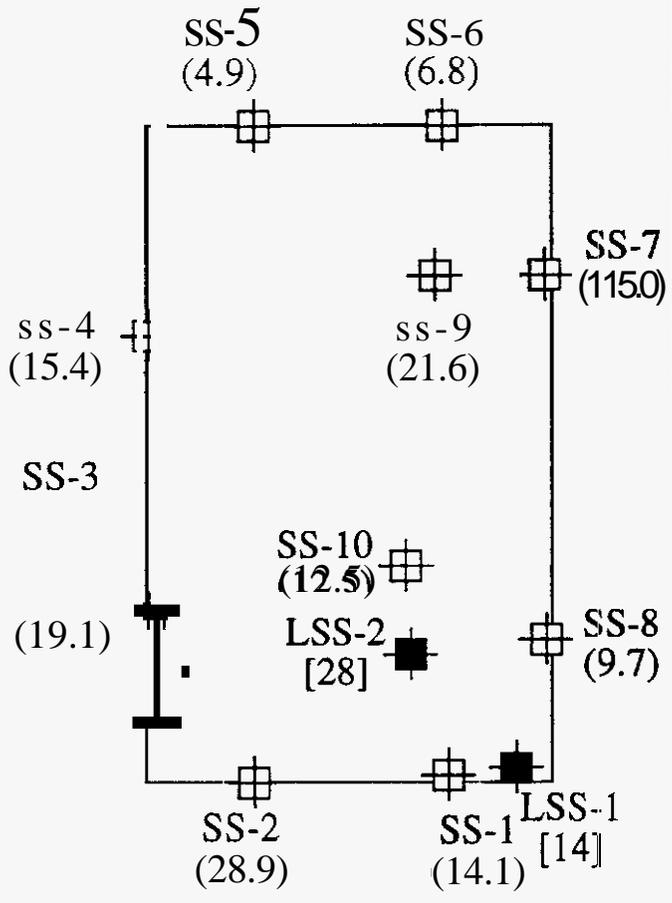

Sampling locations are depicted on the Sampling Schematic attached as Figure 2. The appropriate chain of custody forms are included in Appendix E.

2.3 Analytical Results

The results from analysis with the Photoionization Detector (**PID**) and the Non-Dispersive **Infrared** (NDIR) Analyzer of the ten samples obtained from the excavation and the two samples obtained from the stockpile are as follows:

TABLE I - PID AND NDIR RESULTS

Sample No.	TOV (ppm)	TPH (ppm)
SS-1	N.D.	14.1
SS-2	N.D.	28.9
SS-3	N.D.	19.1
ss-4	N.D.	15.4
ss-5	N.D.	4.9
SS-6	N.D.	6.8
ss-7	N.D.	15.0
SS-8	N.D.	9.7
ss-9	N.D.	21.6
SS-10	N.D.	12.5

SAMPLING SCHEMATIC

1,000 gallon UST excavation at:
 US Army Reserve Center
 Chicopee, Massachusetts

PROJECT: 37.04.483

NOT TO SCALE

FIGURE: 2

N.D. = None ~~Detected~~ (Detection Limit < 1 ppm)

Laboratory analytical results of the two soil samples revealed 14 ppm TPH for LSS1, 28 ppm TPH for LSS2, and 24 ppm for LSS-3 (Appendix D).

Laboratory analytical results for the sample of the tank contents (w.o.) revealed 3,000 parts per billion (ppb) Tetrachloroethene, 2,000 ppb 1,1,1-Trichloroethane, and 2,700 ppb Trichloroethene. Analytical results for Semivolatile Organic Compounds revealed; 48 ppm Bis(2-ethylhexyl)phtalate, and 25 ppm 2-Methylnaphthalene. Analytical results for 13 Metals by TCLP revealed 1.9 ppm Lead, 0.07 ppm Nickel, and 8.0 ppm Zinc. No PCBs were detected. The Flashpoint was 82°F, and revealed a pH of 6.1.

3.0 SITE REMEDIATION AND CONTAMINATED SOIL DISPOSAL

3.1 Site Remediation

The results of the **NDIR** Screening and laboratory analyses for the soil samples collected during the tank closure were submitted to the **U.S. Army** in a Post Removal Report dated January 2, 1992. Based upon **NDIR** Screening and laboratory analytical results, remedial excavation of petroleum contaminated soil was not requested by the **U.S. Army** for UST No. 0070.

3.2 Soil Stratigraphy

Contact specifications do not require a stratigraphic soil section if site remediation *is* not conducted. Therefore, a soil stratigraphy figure *is* not included within this technical report. See section 2.1 for soil description.

3.3 Contaminated Soil Disposal

contaminated soil disposal was not required for UST No. 0070.

4.0 HYDROGEOLOGICAL SERVICES

Hydrogeological services were not performed relative to UST No. 0070.

5.0 BACKFILL

On December **4, 1991**, approximately **43.3** tons (**28.9** cubic yards) of soil was used to fill the excavation associated with the removal of UST No. 0070. Backfill material consisted of **23.9** cubic yards of native soil which was excavated to free the tank and **5** cubic yards of bank run sand. Bank run sand contained particles which were **less** than three inches in diameter and was free from roots and debris, **as per** Section **4**, Paragraph **5** of the contract. Backfill material was compacted and tamped to contract specifications utilizing an excavator. The excavation was backfilled to subgrade level prior to site restoration.

6.0 CONCLUSIONS AND RECOMMENDATIONS

ATEC's conclusions are as follows:

Upon excavation and removal, the tank was observed to be in good condition with no signs of perforation or punctures.

Groundwater was not encountered within the excavation.

Visual inspection of the excavation revealed no stained soil.

Ten soil samples were obtained from the excavation walls for field screening and field analysis utilizing a PID and NDIR Analysis respectively. PID readings were 0 ppm. NDIR results ranged from **4.9** ppm to **28.9** ppm.

Two soil samples were obtained from the excavation for laboratory analysis for TPH utilizing USEPA Method **418.1**. Analytical results for **LSS-1** obtained from the northwest

comer of the excavation revealed **14** ppm TPH. Analytical results for LSS-2 obtained from the bottom of the excavation revealed 28 ppm TPH.

One composite soil sample (LSS-3) was obtained from the stockpiled soils for laboratory analysis. Analytical results for LSS-3 revealed 24 ppm TPH.

ATEC's recommendations are as follows:

Based upon laboratory analytical results, soil surrounding the UST has been impacted by petroleum hydrocarbons. Because analytical results for the sample of the *tank* contents showed relatively high concentrations of chlorinated hydrocarbons, exploratory soil borings should be advanced and groundwater monitoring wells installed to evaluate soil and groundwater in the vicinity of the UST for the presence of volatile organic compounds.

Soil samples should be collected during drilling at five foot intervals using a split-spoon sampler. The samples should be analyzed in the field using a **PID** and the **NDIR**. The soil sample from each boring showing the highest PID reading and/or TPH concentration should be laboratory analyzed for volatile organic compounds. Groundwater samples should also be collected from the monitor wells and analyzed for volatile organic compounds.

ATEC Promises

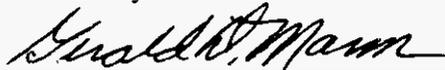

- To be totally responsive to our clients' wants and needs with a constant sense of urgency.
- To perform high quality services with technically superior personnel.
- To perform all assignments for a reasonable fee and within budget.
- To communicate with our clients frequently so there will be **no** surprises.
- To complete our assignments and deliver reports when promised.
- To review reports with our clients to be sure there are no misunderstandings.
- To deliver accurate invoices to our clients within seven (7) days after the completion of the assignment or as required by the clients.
- To follow up with the clients to be sure services completely satisfied their wants and needs.

ATEC Associates, Inc.

**ASBESTOS AND LEAD-BASED PAINT IDENTIFICATION SURVEY
UNITED STATES ARMY RESERVE CENTER
BUILDING #5550
WESTOVER AIR FORCE BASE
CHICOPEE, MASSACHUSETTS**

1.0 SURVEY PURPOSE

Dames & Moore was retained by Anderson-Nichols & Company, Inc. (ANCO) to conduct a limited asbestos and lead-based paint identification survey of suspect roofing materials and associated building components at the U.S. Army Reserve Center (USARC) located in Building #5550, Westover Air Force Base, Chicopee, Massachusetts.

The purpose of this survey was to locate, identify and sample suspect asbestos-containing materials (ACM) that may be contained in roofing components, as well as any associated building components which may be coated with lead-based paint (LBP). This report provides ANCO with information and recommendations regarding the ACM and LBP found during the survey

2.0 BUILDING DESCRIPTION

Building #5550 is a multi-story building, consisting of administrative and training spaces as well as a drill hall. The building is constructed of concrete block with brick exteriors and built-up gravel roofing. The main building was constructed in 1962.

3.0 SURVEY METHODS

3.1 ASBESTOS

The investigative field survey was performed on May 8, 1996 by Mr. Jonathan Ellis of Dames & Moore, who is a U.S. Environmental Protection Agency (EPA) certified Asbestos Inspector. During the survey, suspect roofing components were inspected and quantified and suspect materials sampled. The analytical method used to determine the asbestos content of bulk samples collected during the survey was polarized light microscopy (PLM) with dispersion staining. Samples were analyzed by Dames & Moore's laboratory which is certified to perform sample analysis by both the National Voluntary Laboratory Accreditation Program (NVLAP) and the American Industrial Hygiene Association (AIHA).

3.2 LEAD

Suspect LBP was sampled by collecting paint chips from various exterior building surfaces. The LBP inspection was performed concurrently with the ACM survey. The paint chip samples were submitted for analysis to ESA Laboratories, Inc., of Chelmsford, Massachusetts. The analytical method used to determine the lead content (percentage) of the paint chip samples collected during the survey was the U. S. Environmental Protection Agency (EPA) Method 3050/7420.

4.0 SURVEY OBSERVATIONS AND FINDINGS

4.1 ASBESTOS

Dames & Moore collected a total of 6 bulk samples of suspect ACM. Materials sampled included roofing material and roof flashing. Analytical results for the roofing material and flashing indicated no asbestos content.

4.2 LEAD

Laboratory analysis identified detectable levels of lead in the paint chip samples collected from the roof trim and the exhaust fans located on the roof. This material is similar in color to the paint applied to other roof-associated materials/equipment and is in a loose, flaking condition.

The **Survey** and Sampling Protocol and Limitations are provided in Appendix A. Analytical results of suspect ACM and LBP identified during the survey can be found in the Bulk Sample Analytical Reports in Appendix B1.0 and B2.0. The ACM and LBP Inventory Table is presented in Appendix C. **An** abatement cost estimate for the removal of identified LBP **is** provided in Appendix D.

5.0 RECOMMENDATIONS

No visible ACM was identified which may be impacted by the planned roof replacement project.

Dames & Moore recommends removal of the loose, flaking paint covering the continuous edge flashing roof trim and roof-mounted ventilation equipment prior to the roof replacement project. Complete removal of the LBP is not required, or recommended. Hand scraping of the material, to make the existing paint intact, prior to repainting is recommended. The LBP abatement should be performed by a licensed lead abatement contractor.

6.0 CONSTRUCTION COST ESTIMATE

Dames & Moore has prepared a **construction** cost estimate based on the above recommendations. This estimate was generated using unit price schedules currently **used** in the local industry for lead abatement. The cost estimate for the recommended lead abatement work is **\$9,425.00**. Please note that replacement materials were not specified or included in this cost estimate.

An overview of the current OSHA lead standard is provided in Appendix E.

APPENDIX A

**SURVEY AND SAMPLING
PROTOCOL AND LIMITATIONS**

APPENDIX A

**SURVEY AND SAMPLING
PROTOCOL AND LIMITATIONS**

The facility asbestos survey was conducted by an EPA certified Asbestos Inspector. The lead survey was not performed by Dames & Moore. The specifics of the survey included the following:

- The asbestos survey was limited to roofing materials only. Interior building **areas** were not inspected for suspect ACM which may be located within the building.

Survey data was compiled and reported by building area.

- Suspect ACM was sampled following the protocol detailed in the section below, Bulk Sampling Protocol.
- Lead paint chips were collected and analyzed for lead concentration by percent *dry* weight.
- Information concerning locations, quantities and types of ACM and LBP was gathered during the **survey** and is presented in Appendix C in a tabular format.

ASBESTOS BULK SAMPLING PROTOCOL

During the **survey** of this facility, bulk samples of **suspect** ACM were collected for laboratory analysis. The bulk samples were collected and categorized according to the homogeneous building material being evaluated. The designation of a homogeneous building material was made by the Dames & Moore survey team. Once suspect homogeneous materials were identified, bulk samples were collected of each homogeneous material. If a single sample of a homogeneous material was found to contain asbestos, then that homogeneous material was identified as containing asbestos throughout the building.

Sampling techniques generally involved the following sampling procedures:

1. Core samples were collected of the roofing materials to sample these potentially multi-layered materials. Disposable core boring devices were used for this purpose to minimize potential **cross** contamination of samples.
2. Each sample location was patched/sealed using an asphaltic-based sealant. All samples were given a unique sample number, which included the project number, and were placed in sample containers for transportation to Dames & Moore's laboratory for analysis. Information regarding the sample location was entered onto the Dames & Moore chain-of-custody form. The quantity, location and physical condition of each material was recorded on Dames & Moore's field data sheets.

SURVEY LIMITATIONS

As with any other specific study, a facility asbestos survey is subject to both limitations. Some limitations to be considered in interpreting the results of this survey are as follows:

- A. No asbestos or lead survey will be able to identify all ACM or **LBP** throughout a facility. A thorough study should be capable of identifying approximately 95 percent of accessible (by non-destructive methods) materials present.
- B. This survey was limited to roofing materials and associated building components. No other interior or exterior materials were evaluated during this project.
- C. Dames & Moore identified only those suspect roofing and associated materials which were visible and accessible. Non-accessible areas and materials will require further investigation prior to renovation or demolition activities when future renovation or ~~demolition~~ work would require disturbing these areas or materials.
- D. This report includes only recommendations for the removal of LBP from the roofing flashing and associated roof-mounted equipment, and makes no recommendations or assumptions for any other surfaces which may be covered with **LBP**.

Christopher Strickler
Laboratory Supervisor

Douglas R. Lawson, Ph.D, CIH
Associate, Laboratory Director

Dames & Moore will retain all samples for a minimum of three months. Further analysis or return of samples must be requested within this three month period to guarantee their availability.

Use of the NVLAP and AIHA Logo in no way constitutes or implies product certification, approval, or endorsement by the National Institute of Standards and Technology or the American Industrial Hygiene Association.

Quantification of asbestos content was determined by visual estimation.

The EPA requires that friable samples with analytical results of 10% or less asbestos, by visual estimation, be treated as asbestos containing material unless these quantities are verified using the point counting method. The point counting method is a systematic technique for estimating concentration, also using PLM. If you would like any of your friable samples with asbestos contents of less than 10% to be point counted, please contact our office. Point counting is not required for those samples in which no asbestos is detected during analysis by PLM.

Floor tile and other resinously bound material may yield a false negative if the asbestos fibers are too small to be resolved using PLM. Additional analytical methods may be required. Dames & Moore recommends using Transmission Electron Microscopy (TEM) for a more definitive analysis.

APPENDIX E

OSHA LEAD STANDARD (SYNOPSIS)

LEAD STANDARDS

The Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.62 applies to situations involving lead paint disturbance in structures not used as a residence by children under six years of age and commercial structures. A synopsis of the significant components of these regulations are as follows:

Safety Procedures for Renovation and/or Rehabilitation

On all work areas where renovation or rehabilitation is performed in a manner that disturbs paint, plaster or other materials containing dangerous levels of lead, the employer shall comply with the following safe work practices:

1. Whenever there is an exposure to lead dust, a respirator and personal protective clothing such as those listed in 1926.62 shall be worn.
2. The employer shall not permit employees to eat, drink, smoke, chew (gum or tobacco), or apply cosmetics in the work area.
3. The employer shall provide medical surveillance and monitoring, and exposure monitoring to employees who are exposed to potentially dangerous levels of lead.
4. When tools and/or equipment are removed from the work area, they shall be cleaned with a solution of tri-sodium phosphate (TSP) or vacuumed with a HEPA vacuum. All work areas shall be cleaned at the end of the job with a HEPA vacuum.
5. Adequate precautions shall be implemented to insure that the outside environment is protected, according to applicable state and federal regulations.
6. To prevent contamination of adjacent areas, the employer shall seal off the work areas.

The Environmental Protection Agency (EPA), under the Resource Conservation and Recovery Act has also promulgated regulations for the disposal of (construction debris contaminated with lead based paint. Construction waste containing lead is considered hazardous waste under the EPA regulations if the toxic characteristic is greater than 5 milligrams per liter (>5 mg/L).

ARCHITECTURAL DESCRIPTION (*continued*)

The Westover Armed Forces Reserve Center consists of two components: an original cruciform-plan structure built in 1959, and a rectangular addition to the north arm of the cross in 1978. The long, **one-story**, east-west axis of the original cruciform building is 245 feet long, and the shorter, two-story, **north-south** axis is 132 feet long. All four arms are 60 feet wide. Both structures have flat roofs, and concrete block walls with brick exterior veneer. The west, south, and north elevations of the shorter, **two-story**, east-west oriented axis contain regularly-spaced groups of three metal-sashed, two-pane windows. All arms have overhanging metal coping at the roof line. The west elevation of the north arm of the short axis contains the main entrance, located at the intersection of the long axis. The double entrance doors are sheltered by a cantilevered awning. On the west arm, the north elevation is filled by vertical bands containing grouped windows or brick panels. The west elevation of the long axis contains the legend "UNITED STATES ARMED FORCES RESERVE CENTER" in metal letters and a door. The south elevation contains the loading dock, with double doors, and a row of three small, square windows on protruding concrete sills. The east arm is windowless and slightly lower than the main wing. On the north and south elevations, square stucco panels indicate the previous location of entrances to the drill hall. Only one of these openings, located on the south elevation, is used as a vehicular entrance and contains a roll-type door. Interior features include administrative offices, classrooms, arms vaults, storage, lockers, showers, boiler room, kitchen, and a 3,776-square foot drill hall.

The 1978 addition is attached to the end of the north arm of the building. The addition is a 126-foot by 62-foot, two-story structure with a flat roof. It is divided into 20-foot bays by one-foot wide, vertical, red enamelled metal pilasters. The north and south elevations consist of three bays, and the east and west elevations consist of six bays. The red metal box-section material used for the pilasters is also used as a cornice. All windows are triple-pane, casement type, one pair to a bay. The south elevation only has windows on the first floor, and the other elevations contain both first- and second-story windows. Interior features include administrative offices.

One related building, the Maintenance Shop (MS), or Building 5551, is located approximately 250 feet south of the reserve center. This building was constructed in 1978, along with the addition and renovations made to the reserve center. The maintenance shop is a one-story, brick building, with a flat roof. The front (north) elevation contains five roll-type garage doors. Three are located in a taller, main building, and two smaller doors are located in a shorter wing at the west end of the building. A personnel door is located in the west elevation. A small office is located at the east end of the building. A fenced military vehicle storage lot is located immediately to the east of the building. This maintenance shop is divided into separate interior areas for Army, Navy, and Marines vehicles.

The Westover Reserve Center is located east of Airman Way on Westover Air Force Base, where it is also known as Building 5550. The building is located on a 12.42-acre graded parcel of land set aside for a reserve facility within the air base. The surroundings are landscaped and campus-like, with barracks located to the west. The reserve center is located at the top of a low rise, and the property is open on all sides.

A paved driveway leads from Airman Way to a large parking area to the west of the reserve center and to the loading dock at the south side. This driveway continues east to the drill hall vehicle access door. A separate drive leads to the maintenance shop, and a curving set of terraced concrete steps connects the two buildings. Landscaping is minimal. The reserve center is surrounded by mown lawns, with large oak, maple, and pine trees. Trimmed yews are located at the entrances.

HISTORICAL SIGNIFICANCE *(continued)*

The United States Army Reserve (USAR) is a Federal military **organization** distinct from the full-time, professional Regular Army and the state National Guard. The USAR is **maintained** as a source of **personnel** to rapidly support the Regular Army in the event of conflict. The USAR is composed of "citizen-soldiers," civilians committed to a period of duty in exchange for benefits and pay. The history of the USAR has been characterized by conflict between the Regular Army, U.S. Presidents, and Congress over the combat role and funding of the USAR. This conflict resulted in early **difficulties** in reaching projected **goals for** equipment, facilities, and utilization. The USAR has its origins in the Colonial state militia, informally trained citizens organized against the British Army during the Revolution. The modern USAR has its roots in the Medical Act of 1908, which started a reserve force of medical officers. Distinct organizations of reserve officers and regulars participated in World War I. During the **1930s**, the Works Projects Administration provided reserve officers with the opportunity to run **Civilian Conservation Corps** camps.

The USAR also sent soldiers into combat during World War II. The **postwar** period was a time of change for the USAR, as emerging Cold War defense philosophy called for a larger reserve force to augment the Regular Army. Reliance on nuclear detente during the Cold War drew **attention** away from the development of the USAR, and reduced its effectiveness in the Korean Conflict. The USAR was not a major participant in the Vietnam War, as President Lyndon Johnson anticipated the negative political implications of USAR mobilization for an unpopular war. Under Nixon's 1970 Total Force policy, the USAR was made an all-volunteer force with an increased combat role and increased benefits and pay. Overall, USAR equipment and facilities have been increased since World War II. These gains have been vital for USAR units in reaching unit size and readiness requirements.

The USAR remains an active element in the U.S. military establishment. In the event of mobilization, USAR units are assimilated into the Regular Army to provide service and support. Army reservists today are required to attend forty-eight 4-hour drills per year at a Reserve Center, where Army training staff instruct them in procedure and the use of equipment, and one 15-day intensive summer training camp. Military training personnel of the 98th Training Division are stationed at New England reserve centers to provide instruction. USAR activities in New England and New York are controlled by the 94th Regional Support Command (RSC) headquartered at Fort Devens, Massachusetts.

The Chicopee Armed Forces Reserve Center is representative of a mid-1960s change in Reserve construction policy. The early Cold War reserve center construction program, **1951-1964**, consisted of a series of 23 centers, all designed by the same architect and constructed on land purchased from private parties. After the end of this program reserve center construction policy changed. Some new reserve centers were built on purchased land, and many were located on **existing** defense facilities and made use of existing buildings. In some cases, such as at Chicopee, the Army Reserve shares a preexisting Air Force building with other regular and reserve branches of the U.S. military.

Westover Air Force Base is located on a flat, former **tobacco farming area** in the town of Chicopee. With the decline of Chicopee's industrial base during the 1930s, the town promoted new economic opportunities in the Westover area, and lobbied the U.S. Army Air Corps to locate an air base there. Westover Air Force Base was activated as a bomber base in 1940, and was a vital Military Air Transport System facility, particularly during the Berlin Airlift. By the late 1950s Westover Air Force Base was a Strategic Air Command base, and Eighth Air Force Headquarters. The base was (deactivated during the **1970s**, and property sold back to Chicopee and Ludlow. The base is now the site of the Westover Industrial Airpark, with the Air Force Reserves maintaining a presence. The Westover Reserve Center was constructed as an Air Force Service Club in 1969. In 1976, after Westover Air Force Base closed, the Air Force transferred this facility to the U.S. Army for use as a reserve facility. The building was then altered and enlarged to

INVENTORY FORM CONTINUATION SHEET

Massachusetts

300-man capacity according to plans by Von Storch & Burkavage. This enlargement included the north wing, and the maintenance shop. The new reserve center was rededicated on September 11, 1976. The facility is currently shared by administration and recruiting offices for the reserve forces of the U.S. Army, U.S. Navy, and the U.S. Marines.

The function of this reserve center is to provide administrative, classroom, maintenance, and storage space to Army Reserve personnel and assigned Army Reserve units. The reserve center serves as a base of operations for specialized units that can be mobilized and assimilated into the Regular Army when required. At the reserve center, assigned Army Reserve units receive advanced individual training in the use of military equipment, weapons, tactics, and vehicles. In the event of mobilization with a draft, U.S. Army training instructors stationed at the reserve center are deployed to conduct basic training of draftees. Military instruction at the reserve center takes place in the classrooms and in the drill hall, which is used for general assemblies and drill practice and can accommodate large military vehicles. A kitchen is also associated with the drill hall. Administrative office space is provided for full-time unit support personnel, including the Facility Manager, who is responsible for the day-to-day operation and maintenance of the facility; and the Unit Administrator, who is responsible for unit personnel, pay, promotion, and supply. In the event that the assigned reserve units are mobilized, the reserve center also provides home support for the units. The reserve center also serves as an Army Reserve recruiting center.

This maintenance shop is a motor vehicle garage used by reserve center personnel for routine periodic maintenance and storage of smaller assigned unit vehicles. Tasks performed at the maintenance shop include oil changes, lubrication, battery filling, light running repairs, and minor maintenance such as tire changing, replacement of light bulbs, and minor painting, tuning and washing. Heavier repairs are performed at a centralized regional Area Maintenance Support Activity (AMSA) facility which is discussed on a separate form. The maintenance shop is now also used for unit equipment storage, with most assigned unit vehicles stored outdoors.

The Westover Air Force Base Armed Forces Reserve Center, Chicopee has been evaluated as a contributing resource to a potential Westover Air Force Base National Register historic district. The Massachusetts Historical Commission found Westover Air Force Base eligible in November 1995.

Westover AFRC (MA007)

Facility Description

The Westover AFRC is located within the Westover Air Force Base, northeast of the urban center of Chicopee, Hampden County, Massachusetts (Figure 5-12). The 12.42-acre parcel was transferred to the Army Reserves from the U.S. Air Force in 1976. It is accessed from Sneriden Street to the north, and it is generally surrounded by dormitories and mess halls related to the Air Force base. The reserve center is a former Air Force Service Club that was built in 1959, and the Organizational Maintenance Shop (OMS) was constructed in 1978 approximately 250 ft south of the reserve center. The facility consists of concrete paved parking areas, grass areas, and landscaping surrounding the two buildings.

Environmental Setting

Topography and Physiographic Zone

Chicopee is located in the central portion of Hampden County, in the southwestern part of Massachusetts. This county is bounded on the west by the Berkshire Mountains and on the east by low hills associated with the Worcester Plateau. Physiographically, it is located within the Connecticut Lowlands zone in the eastern portion of the Connecticut River Valley. The main topographic features are the nearly level flood plains and level to gently sloping terraces associated with the Connecticut River and the steep intrusive dikes that rise several hundred feet above the valley floor. The central part of the valley is flanked by undulating to rolling ridges (USDA 1978b). Elevations in the area range from about 40 ft msl around the Connecticut River to about 1,200 ft msl at Mount Tom.

The topography of the Connecticut River Valley shows a distinctive north-south trend that reflects the fracturing and collision of the North American and African crustal plates during the Ordovician and Devonian periods, ca. 350 million years ago. The basic division of the Connecticut Valley was formed at this time with secondary north-south faults along the Swift River Valley of the Quabbin Reservoir. Deep longitudinal basins with sharply defined mountain fronts were formed, with the Connecticut Valley being the largest.

Topographically, the westernmost part of Chicopee is characterized by the Connecticut River floodplain, which extends from South Hadley south to Springfield. The remainder of Chicopee is situated on a plateau with a maximum elevation of approximately 260 ft. The areas surrounding the floodplain of the Connecticut River are remnants of the glacial Lake Hitchcock, one of the longest and largest glacial lakes in southern New England (Hartshorn and Colton 1967:73). Glacial lakes were produced as the glaciers retreated and released enormous quantities of sediments and meltwater. In the Connecticut Valley, the drainage of the meltwaters were blocked by a deposit of glacial sediments at Rocky Hill, Connecticut. Glacial Lake Hitchcock formed between Rocky Hill and the southern end of the glacier. At its greatest extent, it reached 160 miles from Rocky Hill and Lyme, New Hampshire, with a maximum width of 12 miles (Hartshorn and

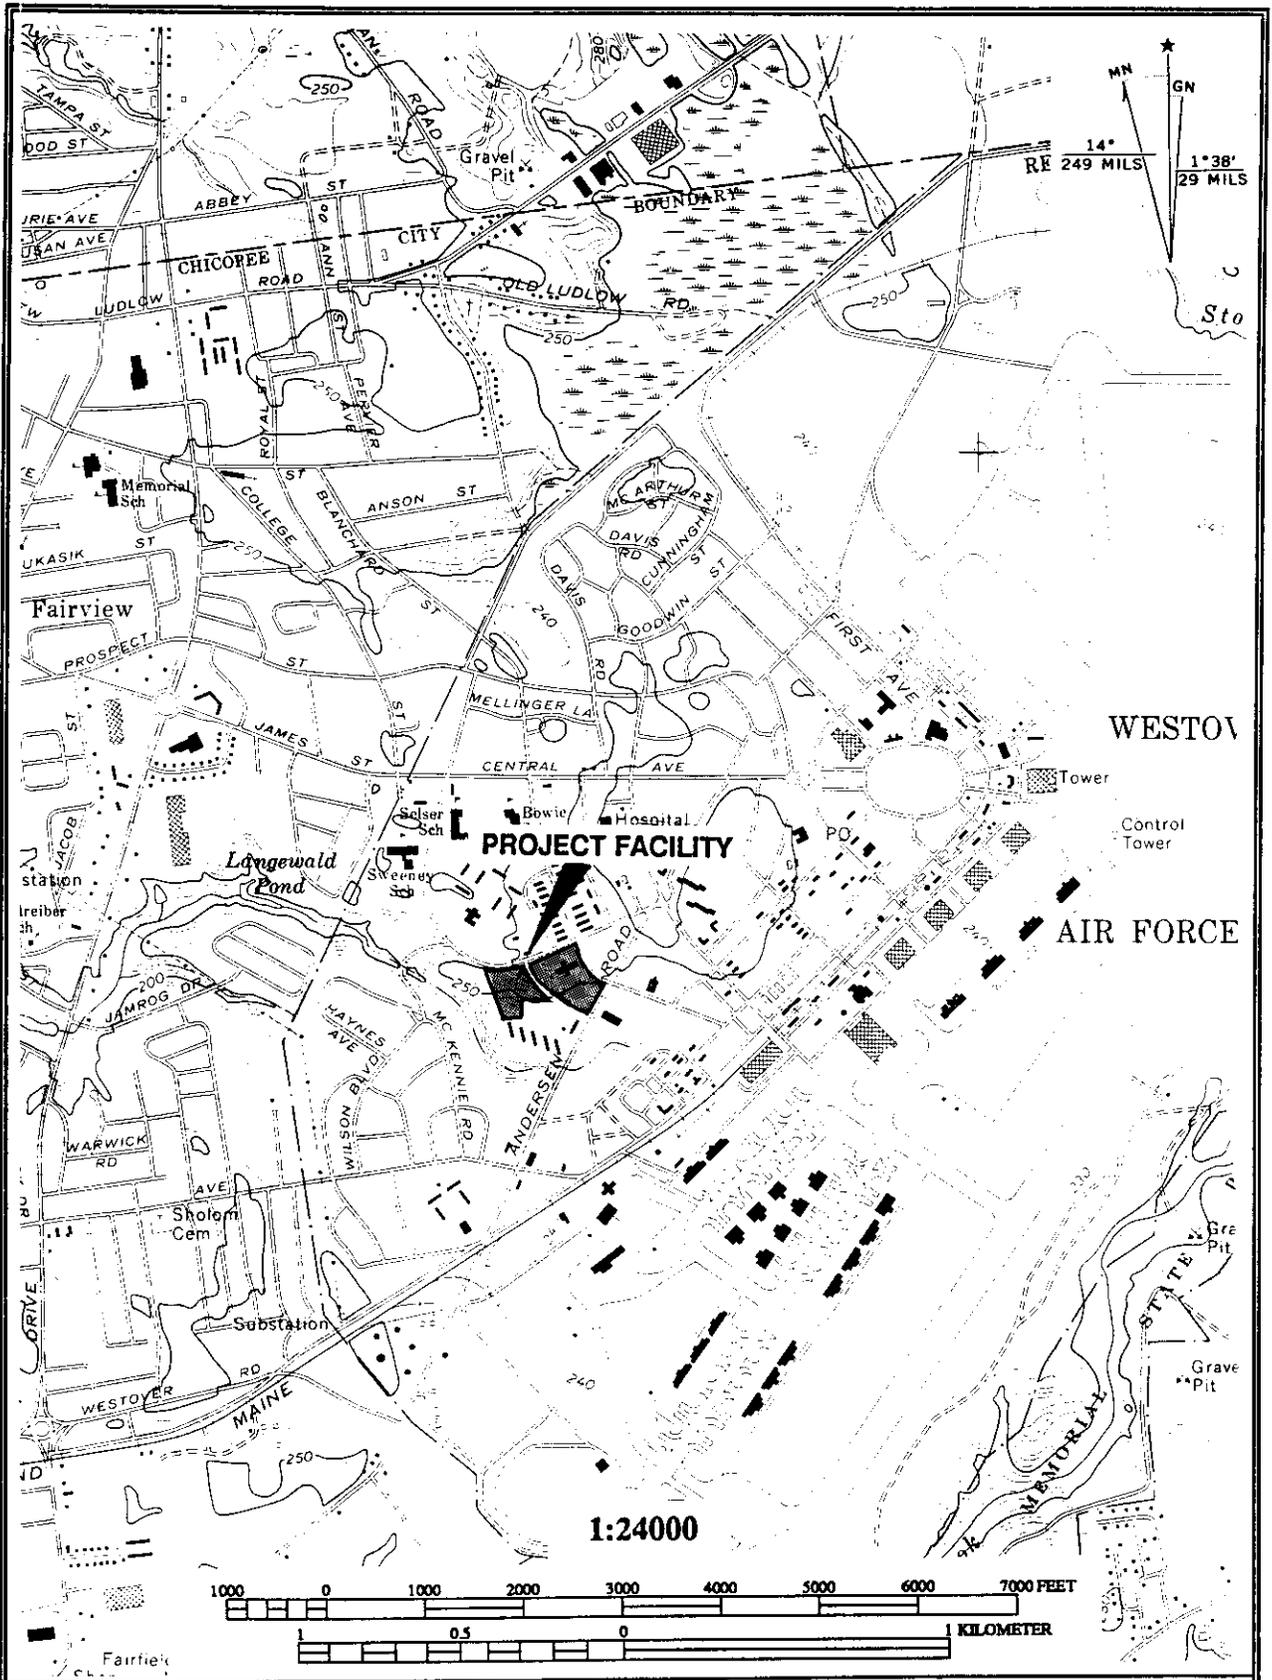

Figure 5-12. Location of the Westover AFRC (MA007) project facility on the Chicopee, Massachusetts USGS topographical quadrangle, 7.5 minute series.

Colton 1967:73). Three large deltas extended into the southern part of glacial Lake Hitchcock and formed large sand plains, including the delta of the glacial Chicopee River. The Westfield and Chicopee rivers together drained a 45-mile glacier margin in the igneous and metamorphic uplands. The bottom of glacial Lake Hitchcock was characterized by varve clays and sediments that alternate between coarse and fine sediments of clay and silts.

The dam at Rocky Hill was breached between 13,000 and 11,000 years ago, and the lake suddenly drained. The Connecticut River began cutting into the former lake bed, creating floodplains. Large sand dunes, some up to 55 ft high, were created by winds on the surface of the dry lake beds and deltas. Abrupt transitions between the lowlands and the uplands lie west and east of Chicopee. The edges of the uplands are marked by a series of mountain peaks, including Mount Tekoa in Deerfield and Butler Hill in Belchertown.

Bedrock, Surficial Geology, and Soils

The bedrock in Chicopee is generally characterized by a Devonian-Triassic valley comprised of trap rock ranges and reddish-brown sedimentary sandstones and shales. These shales contain an abundance of floral and faunal fossils (Emerson 1917; Hartshorn and Colton 1967). In addition, there are a series of well-developed diabase dikes, including Hampden diabase, in this section of the Connecticut Valley. The bedrock is generally covered by a blanket of till with an average thickness of 3 m. This till was derived from the glaciofluvial sediments deposited along the shores of glacial Lake Hitchcock and from postglacial streams carrying upland sediments down to the valley (MDPW 1974).

Soils within the Westover AFRC property are classified as Urban Land-Hinckley-Windsor association (USDA 1978b). This association is made up of Urban Land and nearly level to moderately sloping Hinckley and Windsor soils on glacial outwash terraces. The Hinckley and Windsor soils are located on vacant lots, lawns, and parks interspersed between buildings and streets. These soils are deep and excessively well-drained. Slopes range from 0 to 15 percent. Hinckley and Windsor soil types have few limitations for urban uses (USDA 1978b).

Connecticut River Drainage

Chicopee falls within the Connecticut and Chicopee river drainage systems. These rivers, along with the Westfield River, dominate the drainage of the area. The Connecticut River is New England's longest river and principal drainage. Originating in the Connecticut Lakes, a short distance north of the Canadian border, the river flows south and marks the entire length of the Vermont-New Hampshire border. It then flows through central Massachusetts and into Connecticut, eventually draining into Long Island Sound at Old Saybrook, Connecticut. The total length of the river is 409 miles (Bickford and Dymon 1990).

Through Canada and Vermont, the Connecticut River flows in a narrow valley; over the next 100 miles through Massachusetts and Connecticut this valley broadens considerably, attaining a width of 20 miles in

Connecticut. The Connecticut River and its tributaries drain nearly the entire Connecticut River Valley except on the southeastern perimeter. In the eastern uplands, the major tributaries (south to north) are the Chicopee and its tributaries the Quaboag, Ware, and Swift rivers, and the Fort, Sawmill, and Millers rivers. In the western uplands, the major tributary streams are (south to north) the Farmington River; the Westfield River with its East, Middle, and West branches; the Manhan and Mill rivers; the Deerfield River with its tributaries the North, South and Green rivers; and the Fall River.

The Connecticut, Deerfield, and Westfield rivers have cut narrow gaps in the basalt ridges, affecting the rate of flow. This has caused increased alluvial deposition and created the extensive floodplain characteristic of the areas that comprise Hadley, Deerfield, and Westfield. The Connecticut River, and to a lesser extent its tributaries, are bordered by low, flat terraces of flood-deposited sediments.

The size and contour of the floodplain are the most dynamic of any land formed in the valley. The Connecticut River has continually eroded old floodplain and deposited new alluvial sediments, gradually altering the broad, looping meanders that characterize its course. Numerous ancient channels, some at great distance from the river's present course, attest to the cumulative effects of this process over thousand of years. Many of the wetland areas that border the river are remnants of earlier channels. The river's downcutting to new base elevations has stranded earlier floodplains in the form of alluvial terraces. Oxbow Lake in Northampton and Easthampton, for example, was formed when the Connecticut River cut a new channel through a neck of land. Other significant features include the delta of the Westfield River in Agawam, with local meanders in the valleys of the Deerfield, Westfield, and Chicopee Rivers.

The Westover AFRC is immediately drained to the south by Williamansett Brook, a major tributary of the Connecticut River. The Connecticut River lies about 2 miles west of the project facility and the Chicopee River passes about 2 miles to the south. A limited amount of wetlands is located in the town adjacent to the northern and southern boundaries of the Westover Air Force Base. Only a few ponds are present within the town and none of these are natural (MHC 1982c:1).

Prehistoric Context

The prehistoric context for the Connecticut River Valley and Granby vicinity is presented under the Chicopee facility. Interest in the prehistory of the Connecticut River Valley and its tributaries began during the nineteenth century and increased during the second half, when local antiquarians and historians included site locations in town histories. Prehistoric sites and artifact collections were documented in the town of Westfield as early as the 1830s (Barber 1839:304). Other mid and late-nineteenth-century works include Josiah Gilbert Holland's *History of Western Massachusetts* (1855) and Sylvester Judd's *History of Hadley* (1863).

Collecting activities surged during the late nineteenth century, particularly in Springfield, Holyoke, and Northampton. Some of the largest artifact collections were assembled following intensive plowing and periodic flooding along the Connecticut and Westfield rivers. The late nineteenth century also saw the

beginning of professional investigations with the Harry Andrew Wright excavations at the Contact Period Native American village at the Long Hill Site in Springfield (Wright 1897). Much of the information recorded during the excavations has been lost, but the artifacts are curated at the Springfield Museum. Frederick Ward Putnam of the Peabody Academy of Science and Harvard University excavated a number of burials in the area and collected artifacts from locations in Longmeadow as early as 1883.

During the 1930s and 1940s there was a resurgence in the quantity and quality of archaeological investigations in Massachusetts. Perhaps the most significant development was the formation of the MAS in 1930. This organization provided both amateur and professional archaeologists with a repository for artifacts, a centralized location for recording sites, and a bulletin through which to report finds and site information. William S. Fowler, a former Westfield resident, and William J. Howes were two of the most important individuals in the organization during its early years. The prehistoric Westfield steatite quarry was first described by Jacob Bowne of Springfield College in 1907 and investigated by Fowler and Howes in the 1930s and 1940s (Young 1969:48). Charles Hull, a resident of Agawam, collected artifacts from five nearby towns: Agawam, Southwick, and Longmeadow in Massachusetts, and Suffield and Enfield in Connecticut. Between 1921 and 1946, Hull collected over 2,500 artifacts from plowed fields in these towns (Pretola 1985).

The late 1960s saw the beginnings of CRM studies, with Bert Salwen's survey of the Connecticut River Valley for the National Park Service. In 1970, William Fitzhugh surveyed and excavated sites in Rowe and Florida, Massachusetts prior to hydroelectric development, as part of the first contract salvage archaeology undertaken in Massachusetts. During the 1970s several important sites and archaeological districts were added to the National Register of Historic Places, including the Riverside Archaeological District in Gill and Greenfield and the DEDIC Site in Deerfield.

The combined avocational and professional research on the prehistory of the Connecticut River Valley has resulted in a large database on site locations. The highest densities of sites have been found on alluvial terraces of the Connecticut River and its tributaries and brooks, on bluffs overlooking the terraces, and on sandy terraces bordering uplands that were once the shores of glacial Lake Hitchcock.

The Connecticut River Valley drainage system, with its large and small tributaries, lakes, and wetlands, has been a focal point of prehistoric occupation. Occupation of this area by human populations is likely to have begun more than 10,000 years ago, during the PaleoIndian Period. Clearly identified PaleoIndian Period sites have been found in Deerfield and Hadley, with scattered find spots reported from a number of other areas within the Connecticut River Valley, including Agawam, Montague, Hampden, Gill, Chicopee, and Greenfield. The site in Hadley was not systematically excavated, but fluted points and other PaleoIndian artifacts manufactured from New York flint were collected prior to the site being destroyed (MHC 1984a:25). Controlled subsurface excavations did occur at the DEDIC Site in Deerfield on the shores of the former glacial Lake Hitchcock, overlooking the Connecticut River floodplain (Ulrich 1978).

In Chicopee, at least two fluted projectile points have been located in the Westover Air Force Base area; the only two wetlands in Chicopee are situated along the southern and northern borders of the Westover Air Force Base. This area also contains deposits from glacial Lake Hitchcock, the floral and faunal resources

of which may have attracted PaleoIndian groups to the area. A PaleoIndian site was also reported for the Mount Toby area, where geologists have discovered the once-level shorelines of Lake Hitchcock (Hartshorn and Colton 1967:75; MHC 1984a:25). Clearly identifiable PaleoIndian sites have also been located in Hadley and Deerfield. The Hadley Site is located on a broad alluvial plain of the Connecticut River and contained artifacts made of Hudson Valley chert (Curran and Dincauze 1977:334-335). Excavations at the DEDIC Site in Deerfield found that the site was located on the former bottom of glacial Lake Hitchcock (Ulrich 1978).

The location of these sites indicate a direct association with post-glacial features that no longer exist. Other sites may have been destroyed or not recognized due to changes that have occurred in the environment and topography during and immediately following glacial retreat. Early sites may be located in areas that have changed substantially since they were occupied over 10,000 years ago. For example, upwarping of 4.2 ft per mile occurred after the ice retreated and the lake drained (Hartshorn and Colton 1967:75). In addition, the Connecticut River has cut vertically into the lake deposits in both Massachusetts and Connecticut. In the Springfield South quadrangle, the river has cut through at least 160 ft into lake deposits and cut laterally over 2 miles to the east and west, possibly inundating or destroying early prehistoric sites.

The traditional concept that early postglacial environments were inhospitable is currently being disputed by palynologists (Gaudreau 1988; Nicholas 1988). Recent studies have indicated that glacial lake basins, most active between 14,000 to 11,000 B.P., provided hydrological settings for the development of extensive lake, pond, wetland, and river basin mosaics between 10,000 and 7000 B.P. These were important foci for PaleoIndian and Early Archaic groups (Nicholas 1988:267). In comparison to other parts of the early postglacial setting, glacial lake basins exhibited the highest resource diversity and productivity. The model developed of the landscape sequence following postglacial stabilization includes the presence of lowered or fluctuating lakes, ponds, and wetlands and an emerging riverine system.

The lack of known Early Archaic sites in the Connecticut River Valley is indicative of a situation that prevails over most of Massachusetts and southern New England. Either the full range of diagnostic artifacts have not been identified or site locations are not easily identifiable. There may also have been a change in lake basin productivity over the long term as part of a geographically focused exploitation of the resources within the basin: PaleoIndian sites and depositions are relatively numerous in this area. The availability or diversity of resources may have changed by the Early Archaic, which would alter site location and subsistence strategies (Nicholas 1988:259). This suggests that the land use patterns have not yet been definitively recognized in the archaeological record. The current evidence indicates that Early Archaic groups utilized riverine resources during spring fish runs at such sites as the WMECO Site in Gill (Thomas 1980). In eastern Massachusetts, Early Archaic components tend to occur within major drainage systems, adjacent to large bodies of water (Dincauze 1974).

Sites dating to the Middle Archaic Period are more numerous in the Connecticut River Valley. Sites have been found in a variety of settings and indicate functional differentiation (Dincauze and Mulholland 1977). Comparative data from sites elsewhere in Massachusetts indicate that riverine wetlands and fall lines similar to those along the Chicopee River were a focal point of Middle Archaic activity. By this time the locations

of rapids and fall lines along the Connecticut River the major tributaries would have been well established, although the exact courses may have changed. Anadromous fish were important to the prehistoric diet by the Early and Middle Archaic periods. Falls and narrows would have been the easiest places along major rivers to catch shad and salmon, while confluences of narrower tributaries would have required the least effort. The Dukes Collection from the northern half of the Westover Air Force Base contained a possible Middle Archaic Neville projectile point. This area is more than 1 mile from the Chicopee River and indicates that utilization of wetlands also occurred during this period.

The Late Archaic Period continues the pattern of increasing site density and distribution through its three cultural traditions (Laurentian, Small Stemmed, Susquehanna). Laurentian Tradition materials are the least frequently found in the Connecticut River Valley, with Small Stemmed projectile points the most commonly recovered artifacts.

Several multicomponent sites have been documented in the area. These include the Granfield Site in Agawam which has components related to the three major traditions: with Brewerton points of the Laurentian, Small Stemmed and Squibnocket points of the Small Stemmed Tradition, and Wayland-notched and Mansion Inn points of the Susquehanna Tradition. The Mansion Inn blades were found in a cache, suggesting that they were left by a group that expected to reuse the site location. Subsurface testing at the site excavated a hearth that was radiocarbon dated to 4340 ± 90 B.P. and was most likely associated with the Small Stemmed component (Pretola 1983). The Whalen Site (19-HD-189) in Westfield, just north of the town boundary with Southwick, contained Late Archaic and Early Woodland materials. This site was surface collected for 20 years and is known to have contained a grooved adze, an ovate blade of banded chert, and a Small Stemmed point, as well as several Early Woodland Meadowood points.

The Kellog Brook Site (19-HD-190) is a small single component Late Archaic site located in the uplands adjacent to the Westfield River in Westfield. The importance of tributary streams to prehistoric groups can be seen by the presence of another site on Kellog Brook in Southwick. The Driftwood Site (19-HD-158) is located in Southwick, although little is known about this site except for its location; it was found because artifacts were exposed to the surface during plowing.

The Susquehanna Tradition in the area is characterized by the exploitation of steatite, which was used in the manufacture of pipes and various vessels. A steatite outcrop that was intensively quarried during the Late Archaic has been identified in the uplands associated with the Little River drainage in Westfield. The Susquehanna groups that extracted this material used it to manufacture bowls, cups, and other vessel forms. Numerous broken bowls, discarded bowl preforms, and quarry tools such as picks and scrapers were left at this quarry workshop location. Sets of quarry tools also were made from quartz found in veins exposed on the outcrops and cached on the site for future use (Fowler 1968). Other Late Archaic quarrying in the middle Connecticut River Valley included basalt outcrops that occur along a narrow ridge extending from Westfield to the Hadley/Holyoke area. Talus slopes below the outcrops contain thin prismatic fragments of basalt that were used as preforms for a range of chipped and ground stone tools such as axes, adzes, pestles, and picks. Other talus quarries have been located in the Mount Tom and Holyoke ranges (Howes 1942; MHC 1984a:30-31).

Prehistoric exploitation was extensive in the Chicopee-Hadley-Ludlow area during the Late Archaic Period. Utilization of river fall areas, banks along major and minor streams, floodplain terraces, and uplands have all been documented for the Late Archaic Period. In addition to the diversity of site location, there exists a wide variety of site size and function. Fishing and fish processing has been well documented on a number of sites (Curran and Thomas 1979). Particularly important was the discovery of a cache of Susquehanna Tradition projectile points on a site in Hadley (Dincauze 1975b); evidence of land use patterns of this tradition are very scarce in this part of Massachusetts.

Sites with Woodland Period components are the most numerous in the Connecticut Valley archaeological record. In most of Massachusetts, Late Archaic sites are the most frequent in the prehistoric database. The diversity in site location, size, and function continues into the Woodland Period. The Woodland Period is characterized by the appearance of ceramic vessels. Ceramics have been located on a number of sites in the Chicopee area, including 19-HD-59, 19-HD-8, and 19-HD-222 (Howes 1943, 1954, 1955, 1960, 1964, 1965, 1966). Ceramic workshops have been located in South Springfield, South Hadley Falls, and Westfield. Large fishing station middens have been found at the Riverside District and WMECO sites (Curran and Thomas 1979), and a possible Woodland Period fishweir was reported in Palmer along the Ware River.

Early Woodland settlement patterns are not well-known due to a lack of clearly identified Early Woodland components on sites in this area and elsewhere in southern New England. The South Meadow Site on the lower Little River in Westfield probably has a small Early Woodland component; a chert Meadowood point was found during surface collecting by a local archaeologist (Gorman and Dalton 1988). Site locations that are likely to have been occupied during this period include the first terrace along the Connecticut and Westfield rivers.

Small hunting and gathering camps have been found in numerous upland areas. In Holyoke, an Early Woodland Period cemetery was located at the Holyoke Depot in 1868. Woodland Period artifacts, including ceramics, have been located along the northern edge of the Westover Air Force Base adjacent to the wetland (Mowchan and Cox 1984:27). The Indian Crossing Site in Chicopee is located on a sandy bluff overlooking the Chicopee River; this site was occupied during the Middle and Late Woodland periods for fairly long periods. Features and artifacts reflect resource procurement and processing activities, as well as possibly horticulture (Ulrich 1977).

The Middle Woodland Period continues to be poorly represented in the Connecticut River Valley. For example, the extensive Hull collection from sites in Agawam contains only two Middle Woodland Period artifacts (Pretola 1985:17). In the lower Westfield drainage there are only two sites with Middle Woodland components. A possible Middle Woodland component is present at the South Meadow Site, where a few lanceolate and corner-notched points were found (Gorman and Dalton 1988). The recovery of a few blanks or preforms for smoking pipes at the Westfield steatite quarry suggests that use of this area continued into the Middle Woodland Period (Fowler 1968).

There is substantial evidence that by the Late Woodland Period the Connecticut River Valley contained a number of primary and secondary core areas of settlement. The distribution of diagnostic Levanna points

suggests that a fairly wide range of environmental settings was used in this area (Pretola 1985:17). A large Late Woodland base camp known as the Guida Farm Site (19-HD-111) was located on the floodplain of the lower Westfield River. This site may have been located in this area due to the suitability for maize horticulture. Features exposed on the site during modern loam stripping and sand and gravel extraction include numerous hearths, refuse pits, and large habitation areas where chipping debris, ceramic vessels, and bone and shell fragments were recovered. A number of Late Woodland burials were also recorded on this site during salvage excavations (Byers and Rouse 1960; Young 1969:50-51).

The Palmer Site (19-HD-97) was a Late Woodland and Contact Period cemetery located on an elevated terrace of sand and gravel above a tributary of the Westfield River. This site was accidentally exposed by construction activity in 1975 and contained at least 14 burials. When excavations were conducted, the burials appeared primarily to be single interments of individuals in flexed body positions. One of these flexed burials contained a fragment of sheet copper or brass that was the only grave offering found during the salvage excavations. There were also two multiple burials and a possible bundle burial. Metallurgical analysis indicated that this metal was of European origin and may have been cut from a kettle obtained from trade during the Contact Period.

Expected Prehistoric Resources

The majority of known sites in Chicopee are characterized by low densities of chipping debris including chert, rhyolite, argillite, quartzite, quartz, jasper, and sandstone (Ulrich 1977, 1978). Given the proximity of Williamansett Brook and the upland location, intact soils within the Westover AFRC facility had a high likelihood of containing prehistoric resources. These resources could date from the earliest PaleoIndian Period through Late Woodland Period. They could represent a wide range of site sizes and types due to the proximity of Williamansett Brook and the Connecticut and Chicopee rivers.

Historic Context

During the Contact Period, Native American core areas were located along the Connecticut River and its associated tributaries. These core areas were the center of Native settlement and subsistence patterns and were connected to seasonally occupied sites in the uplands (MHC 1984a:46). The MHC has determined that there were seven major cores in the Connecticut River Valley and four secondary cores. The first regional core extended north from the falls located at Enfield Falls, Connecticut and included Longmeadow, Agawam, Springfield, and the southern portion of Chicopee. A second core area was centered around South Hadley Falls and included northern Chicopee, Holyoke, and South Hadley. The Chicopee/Quaboag/Ware river system connected the Connecticut River Valley with the Brookfield core area. This three river system contained several major falls and was known for its fishing locations (MHC 1984a:49).

Native American groups incorporated anadromous fish, shad and salmon, into their diet. Prior to the nineteenth century when dams, industrial development, and pollution sharply reduced their numbers, salmon

migrated as far as Beecher Falls (347 miles) and shad as far as Bellows Falls, Vermont (195 miles) (Moore and Root 1979:35). Summer Native settlement may have focused on planting small fields, with fall activities aimed at harvesting and storing crops and hunting (MHC 1984a:47). Native groups in this area included the Nipmucks, Nonotucks, and Agawams (Salwen 1978).

The primary mode of transportation during the Contact Period was a system of overland trails that connected different core areas with one another. In the Connecticut River Valley these trails followed the river terraces, the easiest topographical contour to traverse. Through the uplands, the trails followed the course of the tributary rivers, such as the Chicopee and Quaboag rivers. In the rougher upland areas, including Deerfield, the deep river gorges were avoided except at major fall lines, fords, and intervalles (MHC 1984a:50). The major trail in proximity to the Westover Air Force Base was the north-south trail that ran along the eastern side of the Connecticut River from Windsor Locks, Connecticut, to the ford near Chicopee Falls and to Hinsdale, New Hampshire. The trail then continued along the north bank of the river to Chicopee Street (Route 116) in Wollomansuk (Williamset) and north along Prospect and Montcalm streets (MHC 1982c). Chicopee, or Chicuppe, is a native place name that refers to the southern edge of the Chicopee River near its confluence with the Connecticut River (Wright 1911).

The first European settlement was established at Springfield in 1636. Native involvement in the Anglo-Indian fur trade in this area began in the late 1630s. Additional European settlements were slowly added through the middle of the Connecticut River Valley with a series of lightly to moderately populated towns scattered north to the present-day Northfield area and west to present-day Westfield area. Epidemics from this influx of Europeans resulted in the rapid decline in the Native American population and the abandonment of large areas.

European population growth occurred at a rapid pace throughout the seventeenth century. After 1650, groups from one or more towns would band together and move as a unit to a new area (McArdle 1979). The Massachusetts General Court granted this land and established minimum numbers of families for new communities, usually between 20 and 30. In the Connecticut Valley, newly settled villages acted as founder populations. Within a generation of establishment, groups from these villages left to establish new settlements farther out along the frontier.

The majority of new settlements in western Massachusetts were the result of internal growth. The expansion into new areas was risky from the late seventeenth century to the mid eighteenth century due to a series of conflicts that occurred between 1675 and 1765. Northfield, Deerfield, and Brookfield were burned out and temporarily abandoned. Every town north of the Connecticut border was attacked at least once during this period, resulting in the construction of fortifications. Stockades and blockhouses were built in great numbers (McArdle 1979).

It is uncertain when Chicopee was first settled, although by 1675 Springfield residents had settled in Chicopee, then known as the North Springfield district. Early settlements were located on Chicopee Street along the Connecticut River meadows. Chicopee retained close social and economic ties with the neighboring river settlements of West Springfield, Agawam, South Hadley, and Longmeadow (MHC 1982c).

The Chicopee area maintained a strong agricultural base that was supplemented by fishing and also probably hunting. By the mid-seventeenth century, Springfield had established itself as a core area of commercial, political, and social activity with strong ties to Boston and Hartford. Secondary towns such as Chicopee and Agawam supplied grain and livestock to a number of markets, particularly those in eastern Massachusetts (MHC 1984a).

Industrial development began after the end of King Philip's War; the first sawmill at Chicopee Falls was built in 1678. A gristmill was constructed slightly downstream in 1698, and a deposit of iron ore was found slightly east of St. Patrick's Cemetery around 1693. The commercial use of this ore does not appear to have occurred until 1788, when a "hollow ware" furnace was built near Chicopee Falls. Three sawmills marked on the 1794 map of Chicopee and Springfield, upstream of the Route 1.6 bridge, may have been built prior to 1775 (MHC 1982c). In general, industrial development remained modest in the Springfield core area, including Chicopee, through the eighteenth century.

The Springfield regional core continued to dominate the lower portion of the Connecticut Valley through the late eighteenth century. Springfield itself grew considerably as a result of the establishment of the U.S. Arsenal in 1794. The arsenal drew considerable mechanical and inventive talent to the town and surrounding area; secondary manufacturing complexes were established by the early nineteenth century. The manufacturing potential surrounding the Chicopee River was a primary factor in the reorientation of the economic base in the Springfield core area from agriculture to industry (MHC 1984a).

Chicopee started out as an agricultural district of Springfield, but with the influx of outside capital from the Boston Associates, Chicopee emerged as an industrial center on its own. In 1822 the first company town in western Massachusetts was established at Chicopee Falls. The Boston and Springfield Manufacturing Company, changed to the Chicopee Manufacturing Company in 1828, was incorporated to build the cotton mills and town. The establishment of this and sister mills at Cabotville instigated a wide variety of related manufacturing concerns. Other products such as boots and bricks were also made in Chicopee. By the early 1830s Chicopee was considered "the second Lowell" (MHC 1982c).

By the early nineteenth century, Hampden County had a solid industrial base in the towns of Springfield, Chicopee, and Holyoke; it was the only part of the Connecticut River Valley to experience growth. Chicopee was granted separate township status from Springfield in 1848. Arms makers were attracted to Chicopee as early as 1836, and the Chicopee Falls Company was established to manufacture hardware and firearms. During the Civil War, the area was the primary supplier of arms to the Union Army. Chicopee developed as a distinct local core on the basis of manufacturing weapons and cotton milling.

Chicopee continued to be a major economic center during the late nineteenth century. Textiles were still a dominant economic factor, followed by the machine tool industry, which led to the production of bicycles, automobiles, and cars. Between 1870 and 1915, the population of Chicopee tripled, with the most growth occurring after 1905 (MHC 1982c:12). The 1873 (Beers) map depicts the town center at the confluence of the Connecticut and Chicopee rivers, the villages of Chicopee Falls to the east along the Chicopee River, and Willimansett to the north along the Connecticut River (Figure 5-13). At that time the area presently occupied

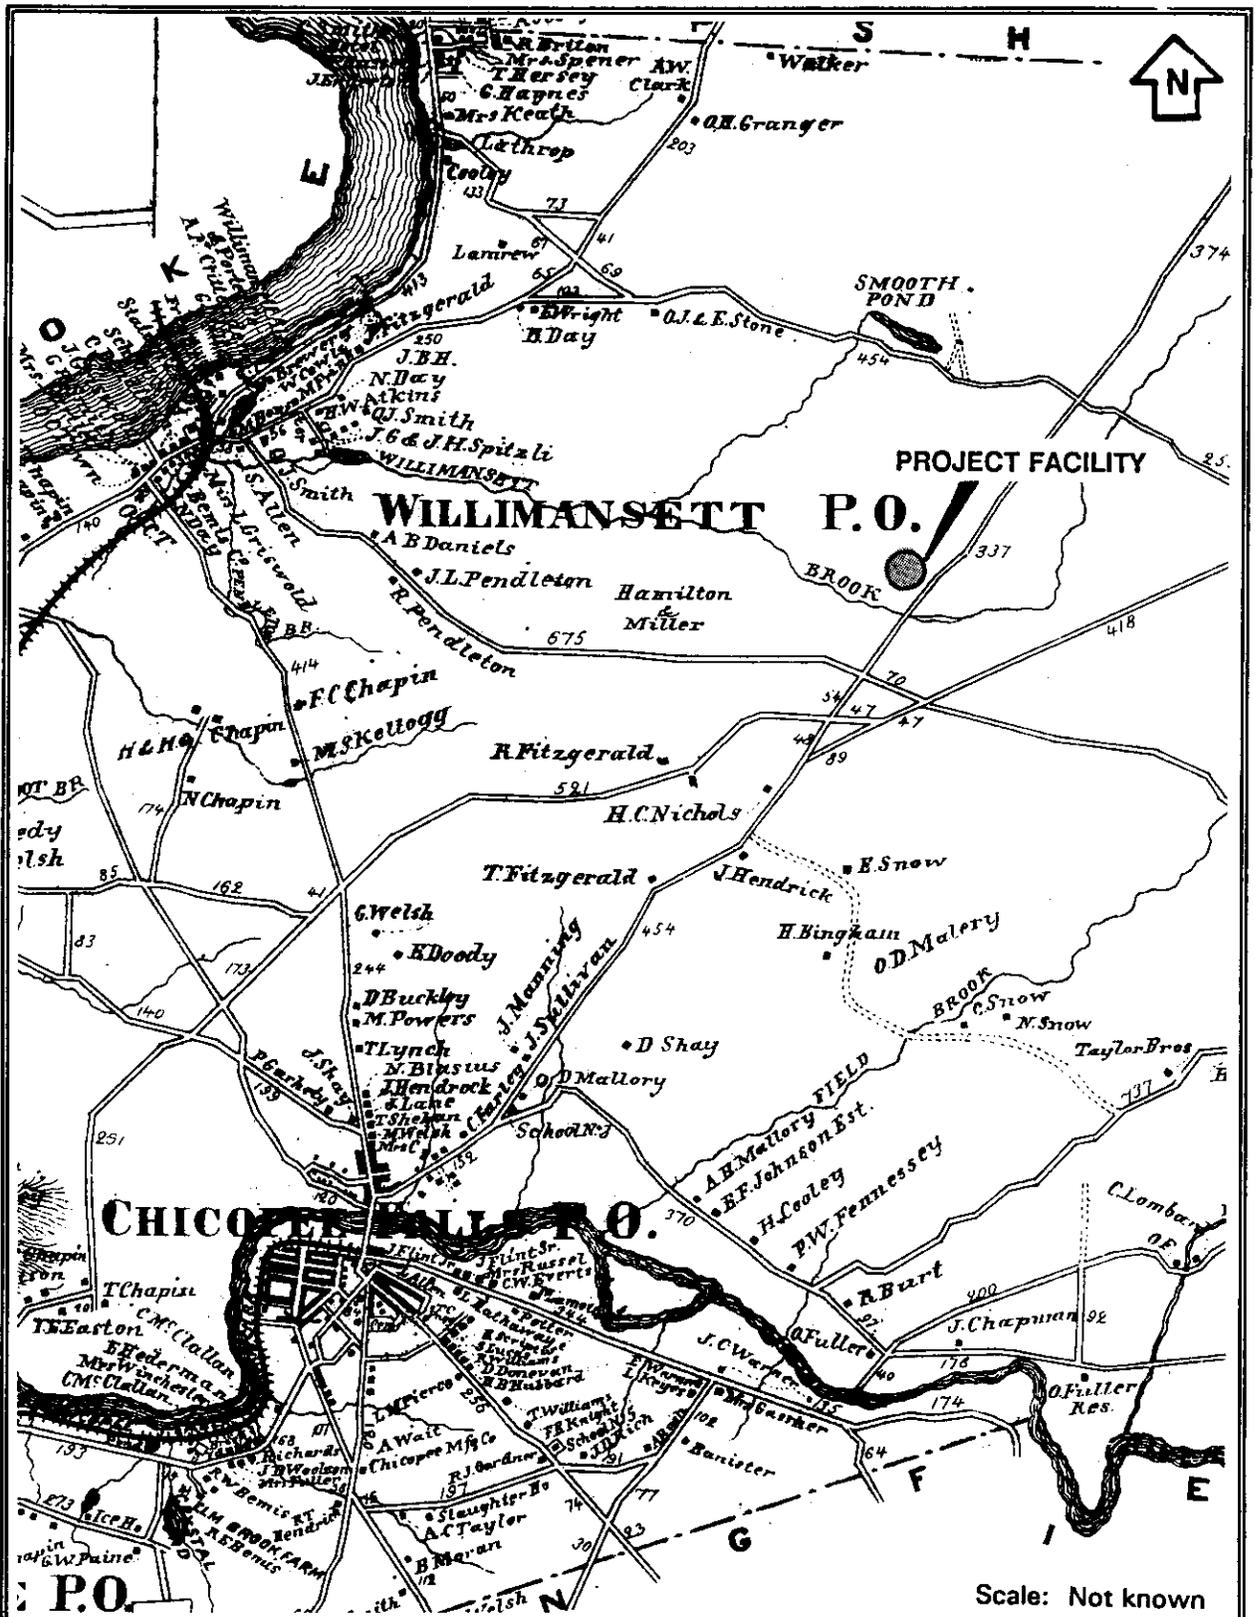

Figure 5-13. 1873 map of Chicopee, Massachusetts with the location of the Westover AFRC (MA007) project facility (source: Beers 1873).

by the Westover Air Force Base was located east of the Willimansett village in a largely undeveloped portion of the town. Chicopee was incorporated as a city in 1890 (MHC 1984a:120). By that time, Chicopee had a substantial business district with a developing suburban periphery. Street railway and trolley lines into Chicopee were built during the late nineteenth and early twentieth century.

Chicopee continued to expand until 1925, when the declining fortunes of the industrial base slowed job opportunities. Most of the competition came from western firms during the early 1920s. The Depression exacerbated a failing situation. By 1933, nearly 25 percent of the population was receiving economic relief. Improvement of the local highways during this period included Chicopee Street as Route 116, a bridge replacement across the Connecticut River in 1931, and other bridge replacements at Cabotville and Chicopee Falls. The Westover Air Force Base was built in Chicopee in 1939 and activated as a bomber base in 1940. Between 1947 and 1955, it was the largest freight and passenger terminal in the Military Air Transport System and was extensively used during the Berlin Airlift.

Expected Historic Resources

A review of late eighteenth and nineteenth-century maps of Chicopee (Chapin 1794; Anon. 1830a; Beers 1873) along with facility files indicates an absence of documented historic period resources within the facility boundaries. Facility files report that the Westover Air Force Base is located on a flat, former tobacco farming area of northeast Chicopee. It was built in 1939 and was not deactivated until the 1970s. No extant structures are noted within the Westover AFRC facility prior to its construction as the Air Force Service Club in 1969. The project property is located near documented Native American Contact Period trails and Colonial sites from the seventeenth and eighteenth centuries. The presence and integrity of any undocumented historic resources within the Westover AFRC facility is dependent upon the degree of previous disturbance related to facility construction and associated earthmoving activity.

Results of Previous Archaeological Studies

The Westover AFRC facility was not included in the 1979 archaeological survey. The 1988 archaeological survey reported that the facility is located atop a steep slope, on artificial step-like terraces; the natural topography of the property was determined to have been extensively modified by construction and landscaping activities (Bourassa and Atwood 1988). An intensive archaeological survey of the parcel was not recommended.

Results of Validation Survey

The validation survey included a walkover of the facility to reassess the previous determination of low sensitivity and recommendation for no further work. A total of 8 shovel turnovers was used to verify the presence of disturbed soils throughout the facility (Figure 5-14). The profiles indicated mottled fill soils (see

CHAPTER 5

Appendix B). The walkover survey, shovel turnovers, and the 1976 facility plan revealed that the natural topography of the facility had been disturbed by the creation of artificial terraces and the construction of the two buildings, paved parking areas, and underground utilities (see Figure 5-14).

Conclusion/Recommendation

Based on the degree of previous disturbance, it was confirmed that this facility possesses a low archaeological sensitivity for intact cultural resources. No further archaeological investigation is recommended.

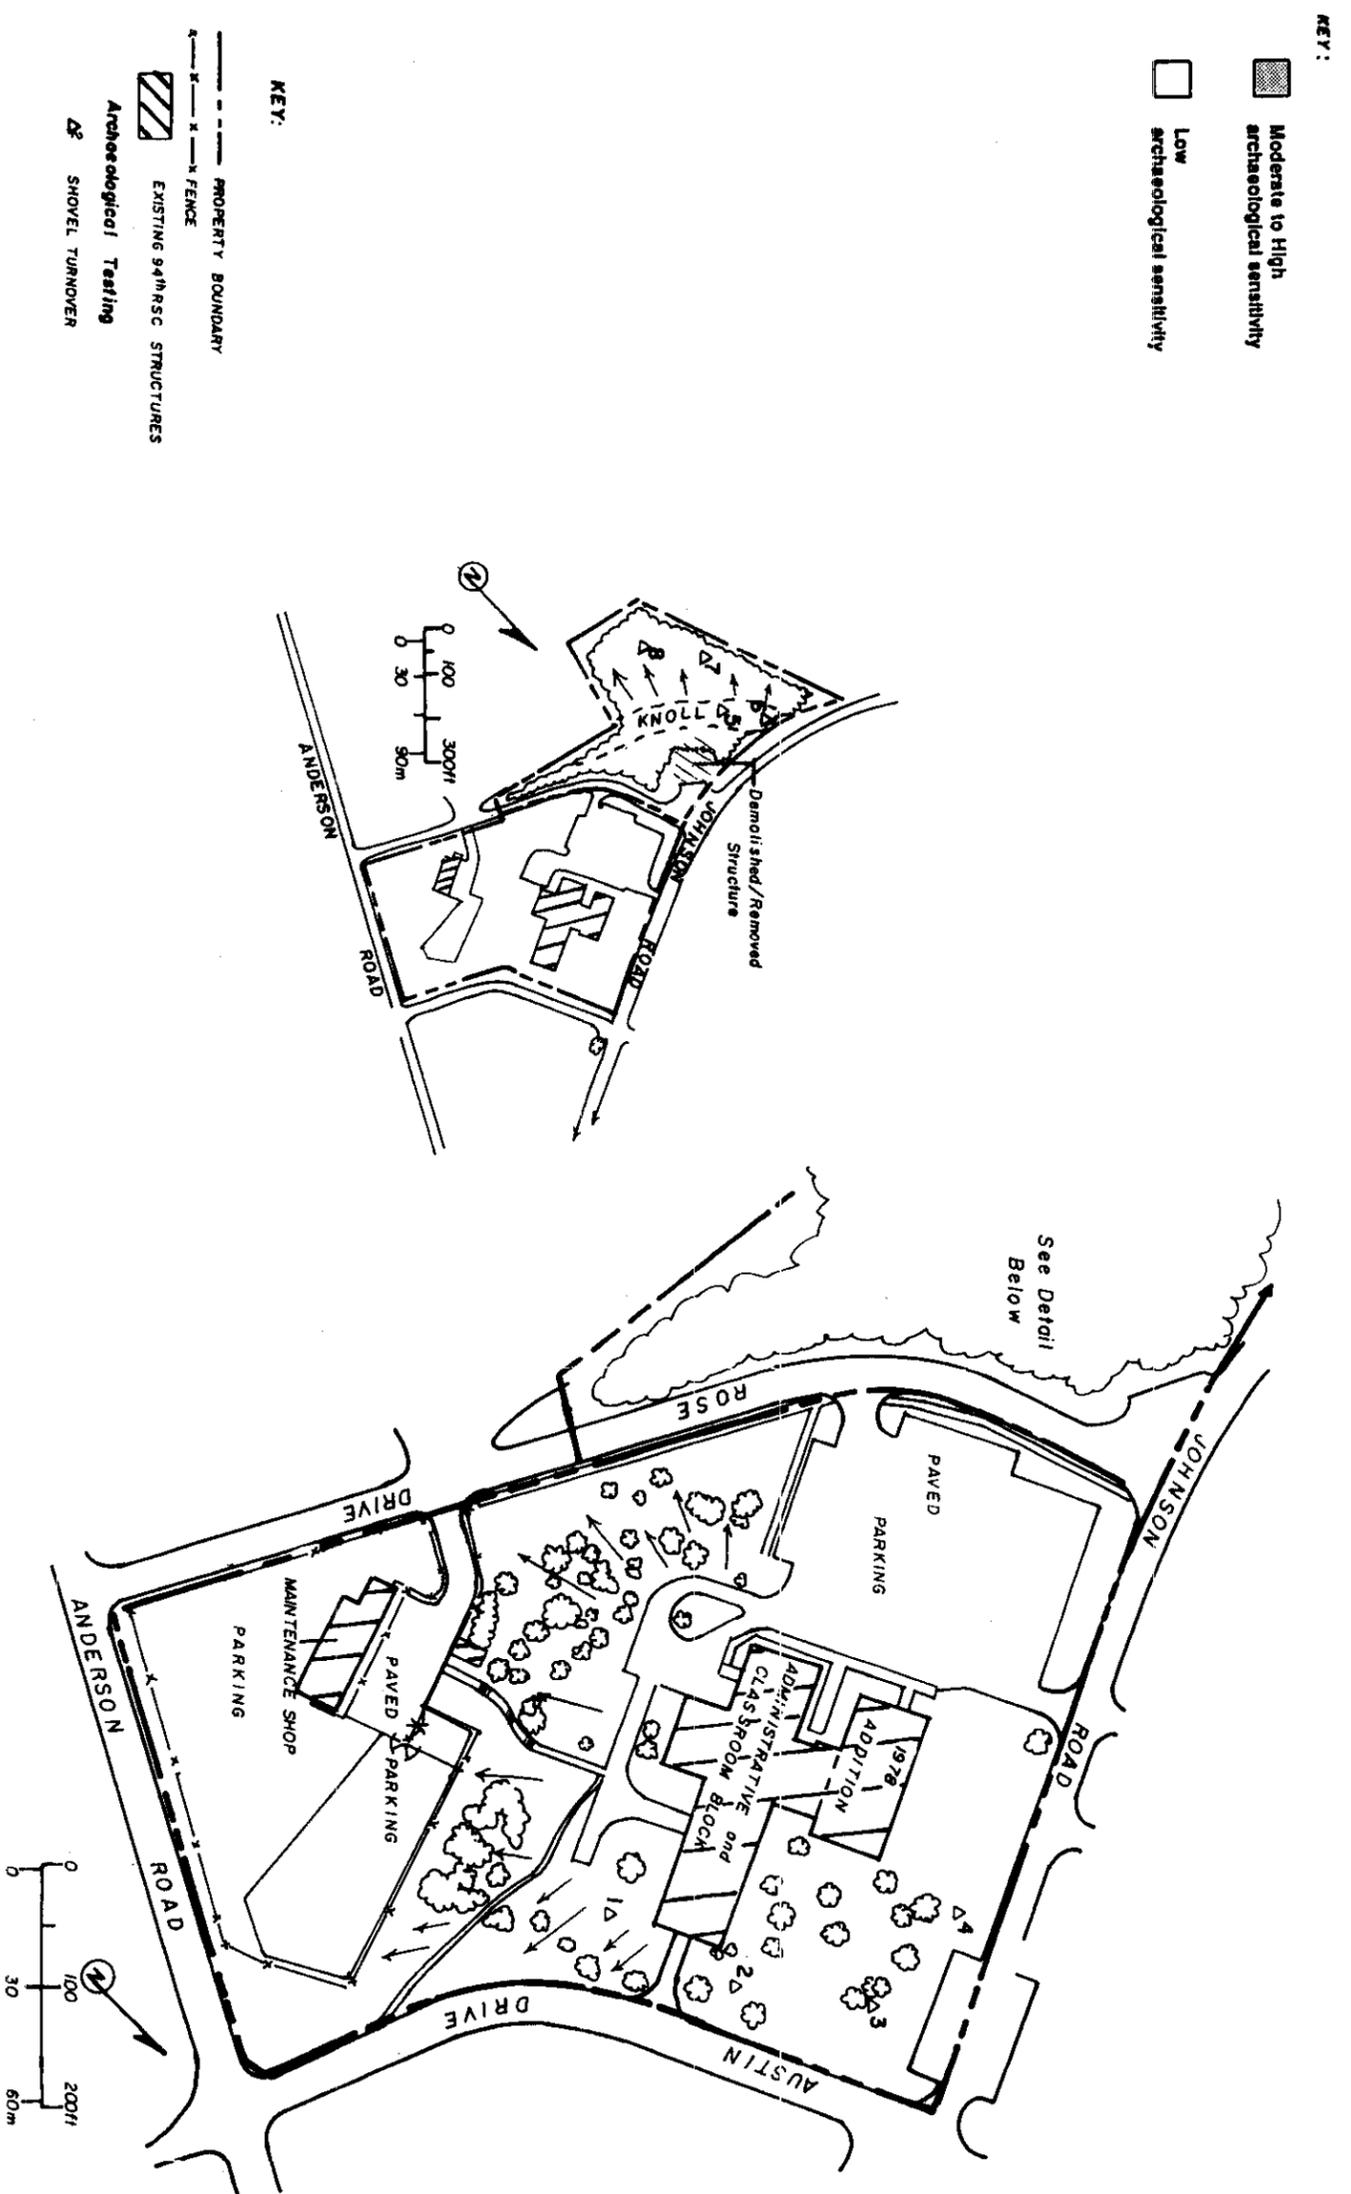

Figure 5-14. Westover AFRC (MAA007) project facility, showing the location of shovel turnovers and archaeological sensitivity.

US ARMY RESERVE CENTER - DRAIN SURVEY
SUMMARY and GENERAL COMMENTS

PAGE 1 OF 7

Facility ID#: MA007 Center Name: Westover AFRC

Address: Bldg 5550, Westover AFB C i Chicopee State: MA

Site Point of Contact: Mr. Bernier Date of Survey: 25-26 May 94

1. Regulatory Compliance Violations:

No regulatory violations were observed during the site visit.

2. Potential Regulatory Compliance Violations:

No potential regulatory violations were observed during the site visit.

3. Recommended Actions to Improve Environmental Practices:

a. Oil/Water Separator Number 1 (OWS-1), OWS-2, and OWS-3 had a definite oil layer on the top. OWS-1, OWS-2, and OWS-3 require maintenance. The sanitary sewer line which drained the OWSs did not have any apparent sheens. AFRC personnel were unaware of the last scheduled OWS servicing. It is recommended that a service schedule be established for OWS-1, OWS-2, and OWS-3.

b. Wash Rack Number 1 (WR-1) is full of silt and should be cleaned out in conjunction with the OWSs. Because of the condition of WR-1 it was not possible to verify that OWS-1 was the pretreatment for WR-1.

c. Storm Drain Number 5 (SD-5) is in the immediate vicinity (60 ft southwest) of a large underground fuel tank. There is a potential for a spill during refueling of the fuel tank to enter SD-5. It is recommended that either a dike be placed around the refueling area or that the AFRC establish a policy to cover SD-5 during refueling operations.

4. Potential Problems:

The Can Wash Number 1 (CW-1) is reported to not be in use. Although CW-1 had a sheen on the water, the source of the sheen could not be determined since CW-1 was bermed and it would not be possible for any runoff to enter CW-1.

5. Uncompleted Inventory Items:

a. The storm drain system on the AFRC feeds into the Westover Air Force Base storm sewer system at three locations. The Air Force base storm water system drains into the city of Chicopee storm drain system.

b. After cleaning WR-1 and the OWSs, verify that WR-1 feeds into OWS-1.

6. Other Comments:

a. SD-8 is full of sand and should be cleaned out.

b. Because the AFRC is located on an Air Force base, the "property lines" are unclear. ENSR only inventoried SDs up to the curb of the streets around the AFRC. The plans show several SDs on the other side of the street which were not included in this report.

c. The Air Force base storm sewer system crossed into and through the USARC "property" at several locations. There were no neighboring units (within one to two blocks) to the USARC that would appear to have any operations that could potentially provide any contamination to the storm sewer lines on the USARC.

7 Data Gathering Parameters and Limitations

This report contains the results of a survey conducted under a series of agreed constraints and limitations described in Section 7.1 below. In addition, site-specific factors may have affected the quality or completeness of data gathered and these are described in Section 7.2 below.

Section 7.1

Surveys were conducted using plans obtained by the Corps of Engineers New England Division from the 94th Regional Support Command drawing vault at Fort Devens, MA. The best available site and interior plans on which the surveys were based, in many instances, did not contain

- a. up-to-date information;
- b. a complete property boundary;
- c. storm water drainage data; and/or
- d. plumbing information.

In some cases, no site and/or interior plans were provided and information was hand-drawn by the survey team.

Data collection was limited to the information that could be gathered in the assigned time frame (ranging from one to two days). No supplementary data collection was performed.

- a. Outfalls to municipal sanitary or storm sewer could not be determined because either manways were located in the middle of streets and could not be safely accessed or a visit to the municipal authorities, which could not be performed within the assigned time frame, would be required to confirm connections.
- b. Information about rooms and/or areas which were not made accessible to the survey team was provided by the facility manager or other facility personnel.
- c. Drains shown on field maps are shown in their approximate location. Locations were not scaled off.
- d. Drainage associated with purely sanitary purposes such as sinks, water bubblers, toilets, or bermed shower drains was not inventoried. Shower drains which were not located in a bermed area and thus could potentially collect drainage other than sanitary were inventoried as floor drains.
- e. Slop sinks which were located on the floor in the janitors closets and could potentially collect drainage other than sanitary were inventoried. Slop sinks attached to the wall were not inventoried.
- f. Military organizational maintenance (-20 level and above) facilities, within EPA Region I, are considered as industrial facilities and, therefore, require an NPDES storm water permit. Because of this requirement, roof drains were inventoried for buildings in which greater than organizational maintenance is performed because these buildings would be considered industrial facilities.
- g. Surrounding property was classified by usage such as residential, industrial, commercial, or woodland according to the visual observations of the survey team. No additional research was performed to confirm this property classification.
- h. The status of drains and pretreatment systems was determined by observation only.
- i. Surface drainage directions were estimated based on observation of land contours. Drainage directions were not determined by observing water flow.
- j. Water meter pits and non-PCB transformers were not inventoried and thus are not depicted on the field map.
- k. Features on the map which did not directly affect the drainage survey were considered to be outside the scope of the field survey and thus were not updated to reflect current status.
- l. Vehicles parked on the site or equipment stored on site or inside the building were not moved to survey for drains.
- m. OMS work pits were inventoried as containing a floor drain based on information from facility personnel. The presence of a floor drain in the work pit could not be confirmed by visual observation because the work pits were either cemented in, covered by equipment, filled with water, or the sump of the work pit was covered by a grate which could not be removed.

Section 7.2

- a. The complete property boundary was not shown on available plans. Facility manger did not know where the property line was. For the survey, property boundary was assumed to be up to the curbs of Rose Drive, Anderson Road, Austin Drive, and Johnson Road.
- b. The Arms Vaults and the Marine Locker Room in the AFRC Building were not accessible to the survey team.
- c. The floor of the X-Ray Room in the AFRC Building was not visible due to storage of boxes on the floor.
- d. Site personnel reported that maintenance is performed in the OMS Building.
- e. The roof of OMS Building was not accessible to the survey team.
- f. The majority of the military parking areas were not visible due to equipment and vehicle parking.

COMMENTS: (1) SD-1 and SD-2 drain to the base storm system north of the USARC, then into the municipal storm drain system. (2) SD-3, SD-4, SD-5, SD-6, SD-7, and SD-8 drain to the base (then municipal storm system) at the west end of the USARC. (3) SD-6 could potentially collect drainage from the maintenance bays of the OMS building and collects roof drainage from the OMS. (4) SD-9, SD-10, and SD-11 drain to the base/municipal storm system at the east end of the USARC. (5) There is a sheen on the liquid in the drain of CW-1. (6) GRT-1 is a pretreatment system for the kitchen sinks and CW-1 and is not associated with any floor drainage. (7) OWS-1, OWS-2, and OWS-3 are labeled "Sediment Interceptors" on the plans. (8) SS-2 has been plugged and covered with a board upon which are stored various paint cans.

Explanations of report codes follow inventory sheets.

US ARMY RESERVE CENTER - DRAIN SURVEY
REPORTING CODE EXPLANATIONS

PAGE 6 OF 7

DRAIN.
TYPE.

- CW - A can wash is a hard surfaced area with a drain, outside. usually next to a kitchen used for washing garbage cans.
- F - A funnel drain collects drainage through a funnel and does not collect any floor drainage directly. These are often found in the boiler rooms
- FD - A floor drain is a grated drain collecting drainage from the floor.
- GP - A grease platform is an elevated structure onto which vehicles are driven for maintenance. A drain is associated with this structure.
- OUT - An outlet is the defined point where the effluent of a pipe discharges.
- RD - A roof drain collects drainage from a roof usually to discharge onto the ground surface or into the storm drainage system
- SD - A storm drain collects outdoor surface drainage usually in the form of a catch basin or drop inlet.
- UIC - An underground injection chamber collects drainage to discharge directly into the ground.
- WR - A wash rack is a hard surfaced area with a drain designated for washing vehicles.

STATUS.

- BLK - The drain is blocked or filled with debris and does not operate properly.
- CIU - The drain is currently in use and is operating properly.
- OTH - The status of the drain is unique and will be further described with a numbered note,
- POT - The drain does not currently operate properly however, it is potentially operational without an extensive amount of work done.
- REM - The drain has been purposely removed from service.

VERIFIED.

- OBS - The issue has been observed by ENSR personnel during the site visit.
- NOP - The issue has not been observed by ENSR personnel from the available plans.
- PNO - The issue has not been observed by ENSR personnel during the site visit but has been observed from the available plans
- REP - The issue has been confirmed by a verbal report from the site personnel.

OUTFALL.

TYPE.

- GRW - The outfall discharges into the groundwater on site.
- LCF - The outfall discharges into a leachfield on site.
- SAN - The outfall discharges into a local municipal sanitary system.
- STM - The outfall discharges into a local municipal storm drainage system.
- UNK - The discharge location is unknown.
- WTF - The outfall discharges to a wetlands area off of the site property.
- WTN - The outfall discharges to a wetlands area on the site property.
- WWTP - The outfall discharges to a waste water treatment plant other than municipal.
- DRY - The outfall discharges to a drywell on site.
- INF - The outfall discharges to an intermittent stream off of the site property.
- INN - The outfall discharges to an intermittent stream on the site property.
- SRF - The outfall discharges to a stream or a river off of the site property.
- SRN - The outfall discharges to a stream or a river on the site property.
- SWF - The outfall discharges to standing water off of the site property.
- SWN - The outfall discharges to standing water on the site property.

VERIFIED.

- OBS - The issue has been observed by ENSR personnel during the site visit.
- NOP - The issue has not been observed by ENSR personnel from the available plans.
- PNO - The issue has not been observed by ENSR personnel during the site visit but has been observed from the available plans.
- REP - The issue has been confirmed by a verbal report from the site personnel.

**US ARMY RESERVE CENTER - DRAIN SURVEY
REPORTING CODE EXPLANATIONS**

PAGE 1 OF 1

TREATMENT.

TYPE.

- ANS - An acid neutralizing sump is a treatment system usually associated with drainage from a battery storage area.
- DET - A detention basin is a treatment system to separate sediment from Storm drainage.
- GRT - A grease trap is a treatment system used to separate grease from the kitchen drainage.
- OWS - An oil water separator is a treatment system used to separate oil and other LNAPL materials from drainage.
- RT - A running trap is a treatment system used to prevent back flow into drainage pipes.
- UNK - It is unknown if the drainage has a treatment system.

STATUS.

- CIU - The treatment system is operating but currently in use and is operational.
- MAT - The treatment system does not function properly and needs maintenance.
- NOT - The treatment system does not operate.
- OCC - The treatment system operates occasionally.

POTENTIAL CONTAMINANTS

- ANT - Anti-freeze.
- BAT - Battery acid.
- CBR - Chemical, biological, or radioactive agents.
- DEG - Degreasing solvent (product).
- DES - Diesel fuel.
- FER - Lawn fertilizer.
- FLO - Fuel oil.
- GAS - Gasoline.
- HAZ - Hazardous wastes.
- JAN - Janitorial supplies.
- OIL - Oil (product).
- OTH - The potential contaminant is unique and will be further described with a numbered note.
- POL - Any combination of petroleum, oil and lubricants.
- UNK - It is unknown if there are any potential contaminants.
- WEP - Potential contaminants may occur due to weapons cleaning in the area.
- WOL - Waste oil.

REGULATORY COMPLIANCE.

- CND - The status of compliance can not be determined based on available information
- IN - The facility is in compliance, based on available information
- OUT - The facility definitely violates regulatory compliance
- POUT - The facility could potentially be out of compliance

MA007NRF	<u>REFERENCES</u>

LETTER FROM THE STATE NATURAL HERITAGE PROGRAMS, INCLUDING RECORDS OF PROTECTED SPECIES ON OR NEAR THE USARC. INCLUDED IS A CURRENT (AS OF MARCH 1, 1994) LIST OF STATE PROTECTED PLANTS, INVERTEBRATES, AMPHIBIANS, REPTILES, MAMMALS, AND BIRDS.

LETTER FROM THE USFWS, INCLUDING A LIST OF PROTECTED PLANTS, INVERTEBRATES, AMPHIBIANS, REPTILES, MAMMALS, AND BIRDS THAT COULD POTENTIALLY OCCUR ON OR NEAR THE USARC.

DATA COLLECTION AND REPORTING ISSUES

US ARMY RESERVE CENTER NATURAL RESOURCE INVENTORY

US ARMY RESERVE CENTER - NATURAL RESOURCE INVENTORY

FACILITY ID#: MA007

CENTER NAME: Chicopee, Massachusetts - Westover AFRC

A. CONTRACT SCOPE-OF-WORK

- Review federal regulations governing preparation of Natural Resource Management Plans for USAR sites.
- Conduct a site visit and inventory existing natural resources based on review of existing on-site reports and a general site walkover. A formal wetland delineation is not a part of this scope.
- Provide to the 94th RSC two copies of the two (2) page draft spreadsheet and map for review, and two copies of the final spreadsheet and map. The final spreadsheet will also be provided on computer disk.
- Delineate vegetative habitats and land uses on the site map provided by the 94th RSC. in pencil.
- Attend three (3) in-progress review meetings in Waltham or at Ft. Devens.
- The project will be completed in approximately 12 months from award date, which was 29 September, 1993.

B. GENERAL DATA COLLECTION AND REPORTING ISSUES THAT ARE COMMON TO ALL CENTERS

- The site inventory was limited to a one or two day visit.
- The inventory could not be conducted during the optimum season at each Center for the following reasons:
 - 1) Waiting to initiate inventories until the spring (mid-April) would not have permitted completion of surveys at all 43 Centers, provide an adequate review period for the 94th RSC. and allow ENSR to complete the final reports by the delivery date of 30 October 1994.
 - 2) A one or two day survey would not have provided a complete set of natural resource data even if it had been conducted in the spring. For example, amphibian surveys would need to be conducted in April and May, while breeding bird surveys should be conducted in early June.
 - 3) Similarly, surveys for protected plants would need to be conducted over a two to four month period, based on the flowering season for each protected species.
- Access to the Center early in the morning (bird studies) and at night (amphibian surveys) were generally impractical due to on-site military personnel availability.

It should be noted that representative breeding bird data were collected at only a few of the Centers.

- The vegetative mapping and land use delineations were plotted on site plans provided by CENED. At some Centers, accurate or up-to-date maps were not available. For a number of Centers, the site plans provided did not include the entire property.
- Limited information was collected for adjacent properties and habitats.
- Development of Natural Resource Management Plans were not within the scope of this project.
- No attempt was made to identify and map every plant at each Center. If several individuals of the same species occurred on a Center, the average height was indicated on the summary legend on the facility base map.

C. CENTER - SPECIFIC DATA COLLECTION ISSUES

Note : Some site specific data, such as weather, survey dates, contacts, etc. are included on the Summary Table for each _____

- 1) The inventory was conducted on 25 May 1994, precluding definitive surveys for breeding birds and flowering plants.
- 2) The property boundary near the housing area and parking lot was not clearly identified
- 3) The Facility Base Map does not include the entire property to the west-northwest. A new base map should be developed.

FACILITY ID#: MA007 CENTER NAME: Chicopee - Westover AFRC ADDRESS: 5555 Westover AF
 CITY: Chicopee COUNTY: Hampden STATE: MA SURVEYED BY: Jim Duncan - ENSR
 COMMAND: 94th SITE CONTACT(S):(Name/Rank/Title) Mr. Bernier DATE OF SURVEY: 25 MAY 94
 WEATHER: (Day 1) 75 deg F. cloudy, winds 15 mph Day 2 NA
 REFERENCE SITE PLAN - TITLE: Grading & Drainage Plan Dwg. No. File No. 7695-823

Scale: 1"=30'

A. FACILITIES/HABITATS	IMPROVED GROUND	SEMI-IMPROVED GROUND	UNIMPROVED GROUND	COMMENTS
Buildings and Paved Areas (ac)	3.45 acres	0.57 acres		Some gravel/grass/dirt parking within fence.
Grassed Areas (ac)		4.41 acres		Primarily lawn.
Wooded Areas (ac)			3.97 acres	Significant stand of mature climax upland hardwoods. Acreage approximate.
Water (ac)				
Total (ac) (12.4 acres)	3.45 acres	4.98 acres	3.97 acres	

PROPERTY LINE NEAR HOUSING AND PARKING COMPLEX COULD NOT BE DETERMINED; ASSUME PART OF PARKING LOT ON CENTER PROPERTY.

B. Human Uses	COMMENTS
Scenic and Natural Areas	None on Center.
Aesthetic Values	None on Center. Upland hardwood forest.
Recreational Areas	Yes. Picnic pavillion with table, barbecue pit, and volleyball court.
Public Use	No.
Military Use Only	Yes.

C. MANAGEMENT PLANS None identified.

C.1 TIMBER Mgmt. Prog. None identified.
 Commercial Forest (ac) Yes. Approximately 3 acres; 50 to 100 commercially valuable oaks.

C.2 Wildlife Mgmt. Prog. None identified.
 Hunting None identified.
 Fishing None identified.

C.3 Programs With State or Federal Agencies None identified.

C.4 Grounds Maintenance	
Landscaping	Yes. Extensive lawn with large native oaks, maples, and pines. Also extensive landscape shrubs around Center.
Prescribed Burning	Not used.
Weed Control	Subcontracted. Primarily lawn care. No evidence of herbicide use. Brush hog used to clear inside of fence.
Agricultural Activity	None observed.
Pest Control	No insecticide us indicated.

SUMMARY AND RECOMMENDATIONS:

SUMMARY:

Significant upland hardwood woodland on Center; many red, black, and white oaks over 70 feet tall
Closed canopy prevents significant understory regeneration.
Lawn areas contain mainly large oak, maple, and pine trees over 50 feet tall

RECOMMENDATIONS:

Remove several of the large oak trees in the woodland to promote understory regeneration. Create brush piles from fallen tree limbs (do not remove from site).
 Plant fruit-bearing shrubs and low growing trees in lawn and along fences.
 Erect gray squirrel nesting boxes (4 in woodland and 2 in trees in lawn).
 Erect American kestrel nesting boxes in open areas (4 total).
 Erect screech owl nesting boxes in woodland habitats (4 total)
 Erect chickadee/tree swallow/nuthatch/wren/bluebird nesting boxes in woodland, on trees in lawn, and along fence (20 total)
 Erect American robin/house finch/eastern phoebe/barn swallow nesting platforms on Center buildings, in woodland, and on trees in lawn (15 total).

RECOMMENDATIONS ARE ONLY SUGGESTIONS AND ARE NOT MEANT TO SERVE AS A MANAGEMENT PLAN.
 PERMITS MAY BE REQUIRED FOR SOME OF THESE ACTIONS.

US ARMY RESERVE CENTER – NATURAL RESOURCES SURVEY

CENTER NAME: Chicopee, Massachusetts – Westover–AFRC

SURVEYED BY: Jim Duncan ENSR

SURVEY DATE(S): 25 MAY 94

WILDLIFE SPECIES REPORTED: None

TABLE A1

WILDLIFE AND VEGETATION SPECIES OBSERVED AND EXPECTED TO OCCUR ON THE CHICOPEE, MASSACHUSETTS AFRC (1994)

WILDLIFE SPECIES OBSERVED

BIRDS	BIRDS	MAMMALS	AMPHIBIANS	REPTILES
Mourning dove	Tree swallow	Eastern gray squirrel	Jefferson salamander ?	
Common crow	Eastern wood pewee	Mole spp.		
Northern mockingbird	Tufted titmouse	Woodchuck		
House sparrow	Bay-breasted warbler			
Rock dove	Blue jay			
Chimney swift	Purple finch			
European starling	Cedar waxwing			
Scarlet tanager	Black-capped chickadee			
American robin	Broad-winged hawk (flyover)			
Chipping sparrow	Common flicker			
Wood thrush	American goldfinch			
Rose-breasted grosbeak				

WILDLIFE SPECIES EXPECTED

	MAMMALS	MAMMALS	AMPHIBIANS	REPTILES
	Silver-haired bat	Woodland vole	Marbled salamander	wood turtle
	Eastern pipistrelle	House mouse	Jefferson salamander	Eastern box turtle
SEE TABLES FOR A LIST OF EXPECTED BIRDS.	Big brown bat	Woodland jumping mouse	Blue-spotted salamander	Northern brown snake
	Eastern red bat	coyote	Spotted salamander	Northern redbelly snake
	Hoary bat	Red fox	Red-spotted newt	Eastern garter snake
	Eastern cottontail	Common gray lox	Redback salamander	Eastern hognose snake
MAMMALS	Eastern chipmunk	Common raccoon	Northern two-lined salamander	Northern ringneck snake
Virginia opossum	Woodchuck	Ermine	Eastern American load	Eastern worm snake
Common masked shrew	Eastern gray squirrel	Long-tailed weasel		Northern black racer
Northern short-tailed shrew	Red squirrel	Striped skunk		Smooth green snake
Hairy-tailed mole	Southern flying squirrel	Bobcat		Black rat snake
Eastern mole	Northern flying squirrel	Whita-tailed deer		Eastern milk snake
Star-nosed mole	White-footed mouse			Northern copperhead
Little brown myotis	Southern red-backed vole			
Keen's myotis	Meadow vole			

VEGETATION SPECIES OBSERVED

	NATIVE SPECIES	TREES	TREES	ORNAMENTAL SPECIES	TREES
GRASSES/FORBS	SHRUBS			SHRUBS	
Yarrow	Honeysuckle shrub	Red oak	Red maple	Winged euonymus	Mimosa
Wild strawberry	Sumac spp.	Paper birch – 2 var.	White pine	Pfitzer juniper.	
Raspberry	Sweet tern	Bigtooth aspen	Scrub pine ?	Yew spp.	
Buttercup spp.	Wild grape	Quaking aspen	Red pine	Common lilac	
Violet spp.	Escaped yew	Black cherry	Eastern hemlock	Cotoneaster spp.	
Ground holly	Escaped juniper	Eastern red cedar	Scotch pine		
		Crab apple	Hazlenut		
		Atlantic white cedar	Pin oak		
			White oak

Re: Rare species information on 12 Army Reserve Centers in Massachusetts
NHESP File No.: 94-112

Dear Mr. Duncan:

Thank you for contacting the Natural Heritage and Endangered Species Program regarding the project referred to above.

Enclosed are print-outs of all the recorded rare species observations for the towns within which the twelve Army Reserve Centers fall, according to our conversation of February 16, 1994. In addition, you will find maps copied from our Priority Habitat atlas corresponding to the quadrangles listed in your letter dated January 18, 1994. The habitats indicated on these maps do not have a regulatory effect, but rather signify areas we consider important for rare species; they demonstrate where most of the rare species listed on the print-outs occur.

Please note that this evaluation is based on the most recent information available in the Natural Heritage database, which is constantly being expanded and updated through ongoing research and inventory. Should new rare species information become available, this evaluation may be reconsidered.

Please do not hesitate to call me if you have any questions.

Sincerely,

Diane Lauber
Environmental Review Assistant

**Massachusetts List of Endangered, Threatened
and Special Concern Species**

This is a copy of the List of Endangered, Threatened, and **Special Concern** Species occurring at **Section 10.60** of Chapter 321 of the **Code** of Massachusetts Regulations and includes vertebrate and invertebrate **animals**, and plants. Attached is an index to the state-listed species.

This list is prepared under the authority of the Massachusetts Endangered Species Act, M.G.L. c.131A. A copy of the complete Endangered **Species** Act Regulations, 321 CMR 10.00, may be obtained from the State House Bookstore, State House, Rm. 116, Boston, MA 02133 (617-727-2834). The cost is \$4.35 if picked up and **\$6.55** if mailed.

The following abbreviations **are** used in **this** list:

E = Endangered: any species of plant or **animal** in danger of extinction throughout all or a **significant** portion of its **range**, and **species** of plants or **animals** in **danger** of extirpation **as** documented by **biological** research and inventory.

T = **Threatened**: any **species** of plant or **animal** **likely** to become **an** endangered species **within** the foreseeable **future** throughout all or a **significant portion** of its range, and any **species** **declining** or rare **as** determined by biological research and inventory and **likely** to become endangered in the foreseeable **future**.

SC = **Special** Concern: any **species** of plant or **animal** which has been documented by biological research and inventory to have **suffered a decline** that could threaten the **species** if allowed to continue unchecked or that occurs in such **small numbers** or with such a **restricted** distribution or **specialized** habitat **requirements** that it could **easily** become threatened within Massachusetts.

(Source: 321 CMR 10.03)

Voluntary contributions to the **Natural Heritage & Endangered Species** Fund provide a significant **portion** of the **funding** for the **Natural Heritage & Endangered Species** Program. Contributions **can** be made **on** state income **tax** forms or **directly** to the **Program** (address above).

10.60: List of Endangered, Threatened, and Special Concern Species

(1) Introduction. The list in 321 CMR 10.60 contains the names of all species of plants and animals which have been determined to be **Endangered, Threatened, or of Special Concern** pursuant to M.G.L. c. 131A and 321 CMR 10.03..

(2) List Format. The columns entitled "Common Name" and "Scientific Name" define the species listed. In the "Status" columns the following symbols are used: "E" for **Endangered**, "T" for **Threatened**, and "SC" for **Special Concern**. The status defined under the "MA" column denotes the official status of the species in **Massachusetts** pursuant to **M.G.L. c.131A** and 321 CMR 10.00. The status under the "US" column is the status of the species under the federal Endangered Species Act at the time of the latest revision of 321 CMR 10.00 and is given for informational purposes only. Recent changes in the federal list might not be reflected on this list. The U.S. Fish and Wildlife Service should be consulted for official and up to date information on the federal status of any species. Inquiries may be made by writing to U.S. Fish and Wildlife Service, 400 Ralph ~~W~~ Marketplace, 22 Bridge Street, Concord, NH 033014901. The Taxonomic Family/Taxonomic Group" column of the list is included for the purpose of organization. The "Notes" column directs the reader to footnotes which further define or clarify the status of a species or alternative names of species.

(3) Organization of the List. The list is generally organized according to the relationship of the listed species as determined by the science of taxonomy, which groups and categorizes species that are similar on the basis of shared evolutionary descent. The most basic division in the list is between **animals and plants**. Within **animals** the list is divided between **vertebrates (animals with backbones)** and **invertebrates (animals without backbones)**. Within **vertebrates, invertebrates, and plants** the list is further divided into categories which are generally recognized, such as **fish, mammals, dragonflies, and violets**. All such information has no regulatory effect and is provided only for the purpose of organizing the list. The following outline shows the taxonomic categories used and their order. A species name in **italics** is provided after the list at 321 CMR 10.61 to assist the reader in finding species on the list.

10.61: Index to State Listed Species

The following **index** is intended to help users of the state list of Endangered, Threatened, and Special Concern species determine the official status of any species listed under MESA. This is particularly important for users of the list who are not familiar with the scientific names of species. Starting with only a common or scientific name, the index tells the user where to find the species on the list. The index accomplishes this by specifying the name of the animal group or plant family under which the species will be found.

For example, to find the status of *Acipenser brevirostrum*, one would look up "Acipenser" in the index and find that it is a fish. Where fish occur in the list is specified by the outline appearing just before the list at 321 CMR 10.60(3). The outline shows that fish is the first category of vertebrate animals. By looking for "Acipenser brevirostrum" in that section of the list one would determine that it is the "Shortnose Sturgeon" and is listed as an Endangered species on both the state and federal lists.

Note that all plants are found under plant families which end with "-aceae" and that animals are listed under commonly known categories, such as birds, mammals, or butterflies.

Index to State Listed Species

Abagrotis, Butterflies and Moths	Bald-sedge, Cyperaceae
Accipiter, Birds	Barn-owl, Birds
Acer, Aceraceae	Bartramia, Birds

March 16, 1994

Jim Duncan
ENSR Consulting and Engineering
35 Nagog Park
Acton, MA 01720

Dear Mr. Duncan:

This responds to your letter dated January 21, 1994 requesting information on the presence of Federally listed and proposed endangered or threatened species in relation to 39 Army Reserve Centers in New England. The centers reviewed occur in: Connecticut (8), Maine (3), Massachusetts (12), New Hampshire (5), Rhode Island (7) and Vermont (4).

Based on information currently available to us, no Federally listed or proposed threatened and endangered species under the jurisdiction of the U.S. Fish and Wildlife Service are known to occur in the project area, with the exception of occasional transient endangered bald eagles (Haliaeetus leucocephalus) or peregrine falcons (Falco peregrinus anatum). However, we suggest that you contact the following for information on state listed species that may be present:

Nancy Murray
Connecticut Natural Diversity Data Base
79 Elm St., P.O. Box 5066
Hartford, CT 06106-5066
203-566-3540

Sue Gawler
Maine Natural Areas Program
State House Station 130
Augusta, Maine 04333
(207) 289-6800

Pat Huckery
Massachusetts Natural Heritage Program
Division of Fisheries and Wildlife
100 Cambridge St., Boston, MA 02202
(617) 727-9194

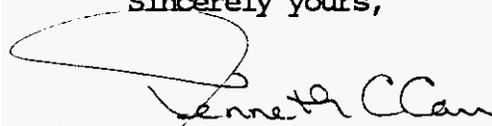

David Moore
New Hampshire Natural Heritage Inventory Program
P.O. Box 856, Concord, New Hampshire 03302-0856
(603) 271-3623

Rick Enser
Rhode Island Natural Heritage Program
83 Park St.
Providence, RI 02903
(401) 277-2776,

Chris Fichtel
Vermont Natural Heritage Program
Agency of Natural Resources
10 South, 103 S. Main St.
Waterbury, VT 05676
(802) 244-7331

Lists of Federally designated **endangered** and threatened species in all of the **New England** state are included for **your** information. **Thank you for your cooperation** and please *contact* Susi von Oettingen of this office at (603) 225-1411 if we can be of further assistance.

Sincerely yours,

for Gordon E. Beckett
Supervisor
New England Field Offices

1.0 INTRODUCTION

The Clean Water Act of 1987 [40 Code of Federal Regulations (CFR) 122] requires Federal installations that discharge stormwater whose quality may be affected by industrial activities to implement plans to control the quality of stormwater discharges. This "*Stormwater-Pollution Prevention Plan*" (SWP3) was developed in response to these requirements. The plan identifies sources of potential pollution, describes "*Best Management Practices*" (BMPs) designed to minimize pollution through prevention and source control, and recommends actions for this facility. The SWP3 also discusses stormwater-runoff drainage, identifies point-source outfalls into local surface waters, and provides non-stormwater discharge certification of stormwater outfalls.

1.1 FACILITY PERMIT

The State of Massachusetts, in which the facility is located, does not have National Pollutant Discharge Elimination System (NPDES) permitting authority. Stormwater permitting in the State is administered by the U.S. Environmental Protection Agency (USEPA) Region I [Stormwater Permit Manual, Thompson Publishing Group, Inc., written commun., July 1998]. The Massachusetts Department of Environmental Protection (DEP) reviews the USEPA's stormwater permits for water-quality certification under Section 401 of the Clean Water Act. State-specific conditions have been added to USEPA's stormwater permits by the Massachusetts DEP to ensure that they do not violate State water quality standards. Massachusetts' stormwater dischargers may seek coverage under the USEPA's multi-sector general permit (MSGP). To obtain coverage, the facility should send completed notice of intent forms to:

Stormwater Notice of Intent (4203)
401 M. Street, Southwest
Washington, D.C. 20460.

1.2 FACILITY DESCRIPTION

Buildings 5550 and 5551 are located at the Westover Armed Forces Reserve Center (AFRC) in Chicopee, Massachusetts (*PLATES 1, 3*). Building 5550 is the AFRC and building 5551 is the Organizational Maintenance Facility (OMF). The AFRC, OMF, and military equipment parks (MEPs, *PLATES 37 to 40*) are surrounded by Radar Hill Drive to the east, Galaxy Road to the southeast, **Airman** Drive to the southwest, and Johnson Drive to the north. USEPA-regulated activities, including the OMF and MEPs, encompass about 12.2 acres at an elevation of about 240 feet above the national geodetic vertical datum of 1929 (figure 1.2). Geographic coordinates for the AFRC are latitude 42°11'37" North and longitude 72°33'27" West.

The primary mission of the Westover OMF is to provide operator and some organizational maintenance for vehicles used by the 287th Medical Company Dental Service (DS). Maintenance conducted by the Army Reserve at the OMF includes support of military vehicles and equipment necessary to perform the units' mission. The mission of the 287th Medical Company (DS) is to provide dental support. Unit personnel perform 20 percent of the organizational maintenance on their vehicles but usually take the vehicles to Area Maintenance Support Activity (AMSA) 72 (C) in Windsor Locks, Connecticut, to do this maintenance. The remaining 80 percent of the organizational maintenance and direct support maintenance for military vehicles used by the 287th Medical Company (DS) is performed by AMSA 72 (G) personnel.

The 287th Medical Company (DS) shares the OMF with the 25th Marines Tube-launched Optically-tracked Wire-guided missile system (TOW) Platoon. Maintenance conducted by the Marine Corps at the OMF includes support of military vehicles and equipment necessary to perform the units' mission. The 25th Marines TOW Platoon is a mobile anti-armor weapon unit. Unit personnel perform first echelon maintenance (similar to operator and organizational maintenance) on vehicles operated by the unit. Higher levels of maintenance (second and third echelon) are performed at the Headquarters (HQ) Marine Regiment in Worcester, Massachusetts. Sometimes a contact team comes to the Westover OMF to perform higher level maintenance for the unit.

1.0 Introduction-Continued

1.3 PLAN DEVELOPMENT

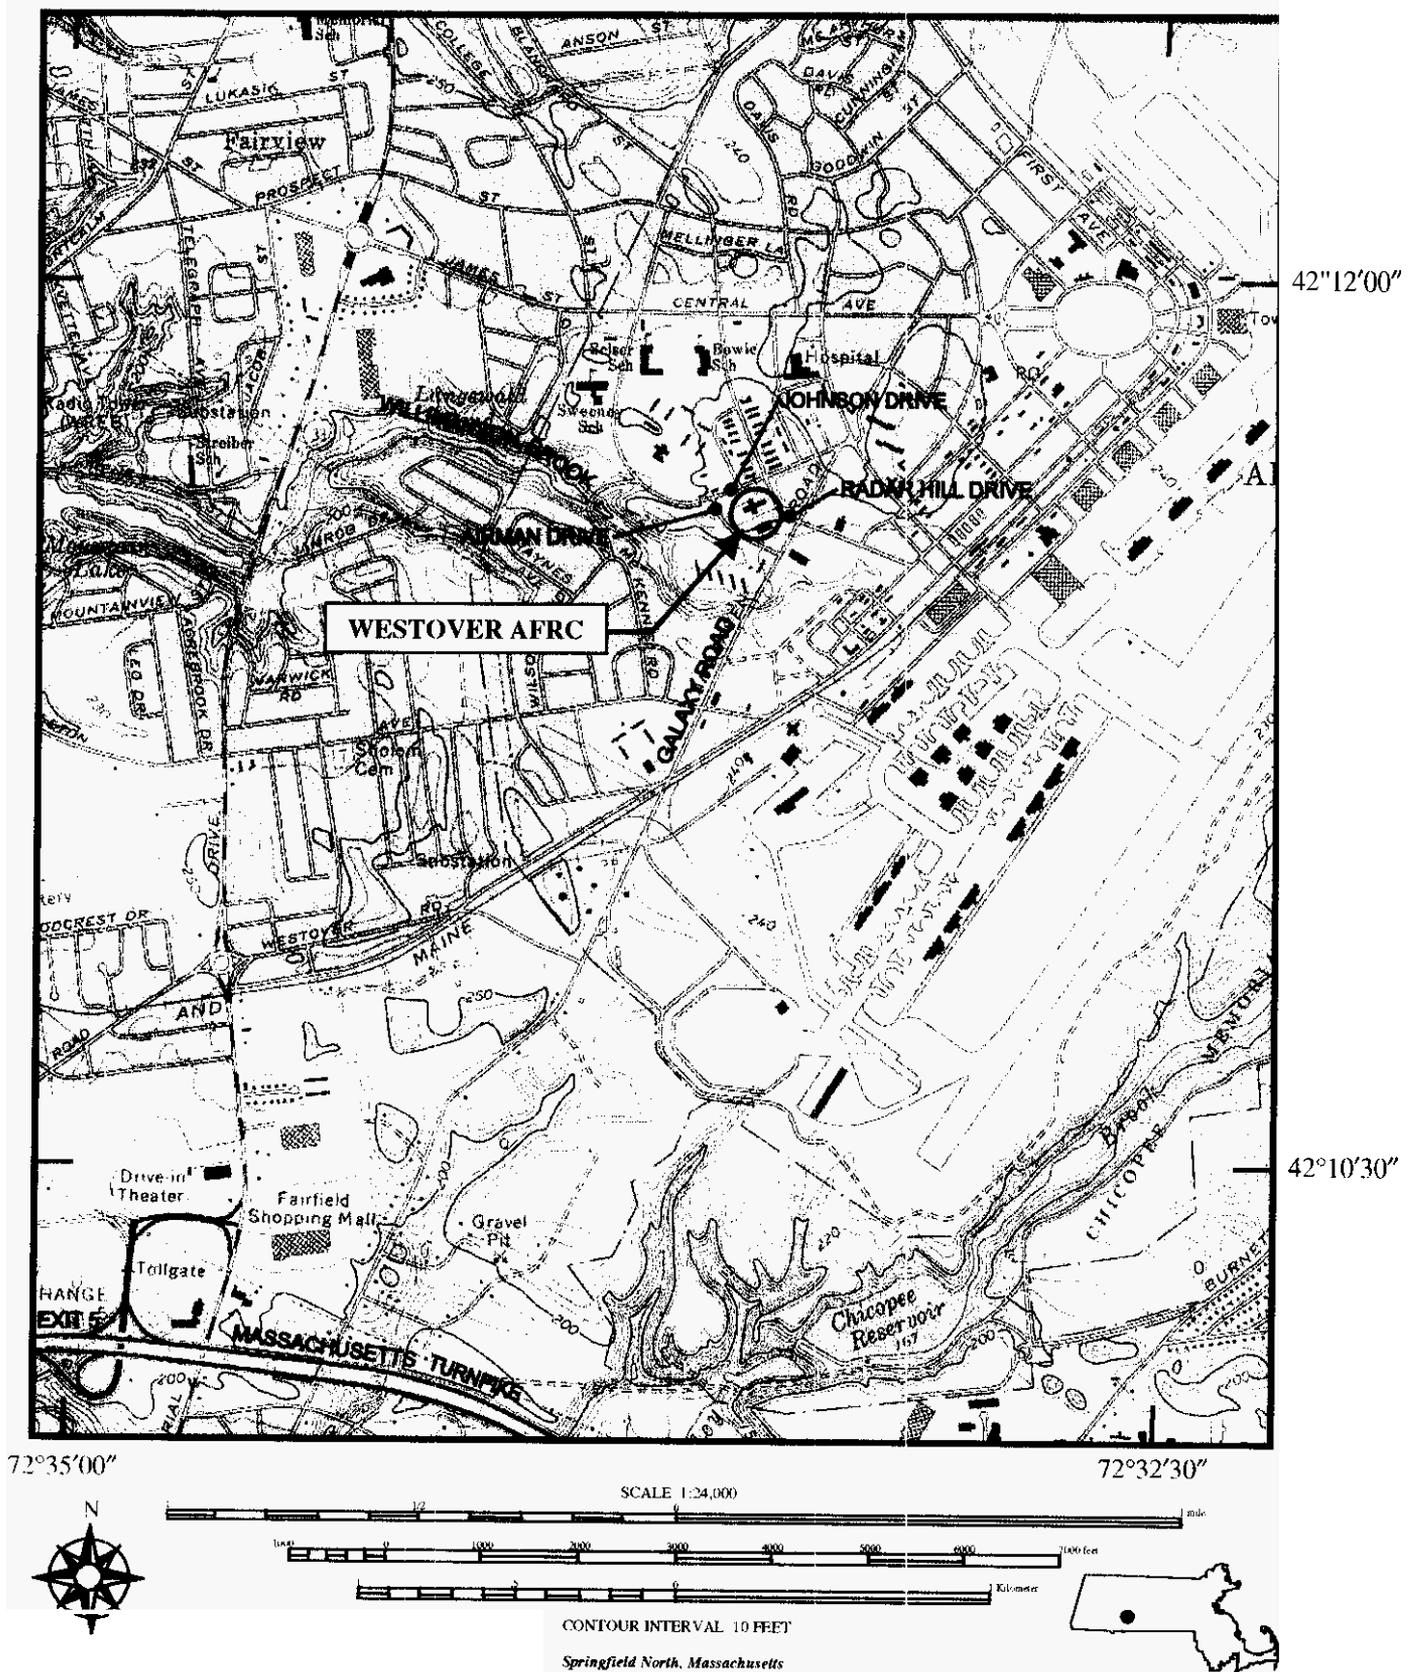

This plan was drafted by the U.S. Geological Survey (USGS), Water Resources Division. Information and illustrations included in the plan were developed from site inspections and from the 94th Regional Support Command (RSC) and USGS databases.

1.4 PLAN REVISIONS

The SWP3 should be updated annually or more often, if required. Many elements of the plan are presented in maps and tables describing (1) sites where potential pollution of stormwater might occur, (2) stormwater-pollution risks from those sites to surface waters of the State, and (3) BMPs that prevent or control stormwater pollution. Detailed notes and sketches should be made during periodic stormwater inspections to facilitate the annual plan revision.

1.0 Introduction-Continued

Figure 1.2--Location Map (source: USGS).

2.0 POLLUTION-PREVENTION TEAM [NPDES.XI.P.2.b.(1)]

The Pollution-Prevention Team (PPT) is responsible for implementing and evaluating the effectiveness of the SWP3 at this facility. Personnel should officially be appointed to the team. Tables 2.0a and 2.0b list the members of the PPT and show their respective duties. Additional members may be appointed to the PPT as needed.

Table 2.0a—Pollution-Prevention Team Members and Duties for the U.S. Army Reserve.

Team member	Duties
94 th Regional support Command - Chief Environmental Division 978) 796-2238	<ul style="list-style-type: none"> • Reviews and approves the S W 3 and any modifications or updates to the plan in coordination with State and Federal regulators. • Provides guidance and information as requested. • Performs annual site compliance inspection.
Regional Facility Manager - Vermont ,802)773- 1786	<ul style="list-style-type: none"> • Reviews and approves the SWP3 and any modifications or updates to the plan.
Westover AFRC Facility Coordinator (413) 593-1110	<ul style="list-style-type: none"> • Implements the stormwater-pollution prevention program at the facility. • Schedules meetings of the PPT. • Signs documents and certificates required in the S W 3 . • Prepares cost estimates for implementation plans for advanced and baseline BMPs at the facility. • Submits requisitions and work orders and promotes self-help initiatives. • Reviews monthly stormwater-inspection checklists. • Serves as backup emergency-response spill coordinator for the facility. • Informs Commanding Officer and 94th RSC of problems and equipment and training needs.
Westover OMF Motor Sergeant 413) 593-6329	<ul style="list-style-type: none"> ▪ Assists Facility Coordinator with implementation of the SWP3 at the facility, including plans for equipment, construction, and training. • Serves as official emergency-response spill coordinator for the facility. • Conducts monthly stormwater inspections and files inspection reports. • Inspects hazardous material and waste-storage areas, updates records on those areas, monitors waste generation, and monitors the transfer of such materials among units. • Ensures that OMF personnel implement good housekeeping, preventive-maintenance, and spill-prevention practices at the motor pool.

2.0 Pollution Prevention Team - Continued

Table 2.0b—Pollution-Prevention Team Members and Duties for the U.S. Marine Corps.

Team member	Duties
14 th Regional support Command - Chief Environmental Division 978) 796-2238	<ul style="list-style-type: none"> • Reviews and approves the SWP3 and any modifications or updates to the plan. • Provides guidance and information as requested. • Performs annual site compliance inspection.

Nestover AFRC I Captain 413) 593-5252	<ul style="list-style-type: none"> • Reviews and approves the S W 3 and any modifications or updates to the plan in coordination with State and Federal regulators.
Nestover AFRC I Staff First Sergeant 413) 593-5252	<ul style="list-style-type: none"> • Implements the stormwater-pollution prevention program at the facility. • Schedules meetings of the PPT. • Signs documents and certificates required in the SWP3. • Prepares cost estimates for implementation plans for advanced and baseline BMPs at the facility. • Submits requisitions and work orders and promotes self-help initiatives. • Reviews monthly stormwater-inspection checklists. • Serves as backup emergency-response spill coordinator for the facility. • Informs Commanding Officer and Facility Coordinator of problem and equipment and training needs.
Nestover OMF I Staff Motor Transport Chief 413) 593-5252	<ul style="list-style-type: none"> • Assists First Sergeant with implementation of the SWP3 at the facility, including plans for equipment, construction, and training. • Serves as official emergency-response spill coordinator for the facility. • Conducts monthly stormwater inspections and files inspection reports. • Inspects hazardous material and waste-storage areas, updates records on those areas, monitors waste generation, and monitors the transfer of such materials among units. • Ensures that OMF personnel implement good housekeeping preventive-maintenance, and spill-prevention practices at the motor pool.

3.0 ASSESSMENT [NPDES.XI.P.2.b.(2)]

As required by the USEPA multi-sector general permit, the site assessment includes a description of potential source(s); of pollutants that may affect stormwater discharges or which may cause the discharge of pollutants during dry weather from the facility. All activities and materials that may be potential pollutant sources are identified. Pollutant sources are referenced to stormwater outfalls to aid in conducting the risk assessment, implementing BMPs, and updating the SWP3.

3.1 SITE MAP [NPDES.XI.P.2.b.(2)(a)]

The USEPA stormwater regulations require that a facility site map be developed as part of the SWP3. Required elements of the **map** include locations of industrial activities, stormwater structures, and the directions of stormwater runoff. The site maps (figures 3.1a and 3.1b) show **primary** stormwater-drainage directions, outfalls, and the location of buildings and facilities. Stormwater-control structures, pollutant sources, and areas at high risk for pollution are labeled with site map codes.

3.2 DRAINAGE [NPDES.XI.P.2.b.(2)(a)]

Site observation of the Westover AFRC identified three stormwater outfalls (OF-1 through OF-3, figures 3.1a and 3.1b) that could be subject to USEPA stormwater regulations. OF-1 is a storm drain in MEP 1 that includes runoff from the **grass** hill between the AFRC and the MEP (*PLATE 42*). Regulated activities within the drainage area of OF-1 include potential **leaks** from military vehicles parked at MEP 1 (*PLATES 37, 38*). MEP 1 is a paved parking area surrounded by an asphalt berm on the northern, eastern, and southern sides. Spills and leaks from military vehicles parked in a MEP commonly result from an inadequate facility preventive-maintenance program, including a lack of available drip pans and infrequent vehicle inspections (see section 3.9). Stormwater leaving the facility at OF-1 drains into the storm-sewer system on Galaxy Road. The storm-sewer system directs stormwater southwest along Galaxy Road and discharges into Willimanson Brook. Willimanson Brook directs flow west and north through Mountain Lake into the Connecticut River.

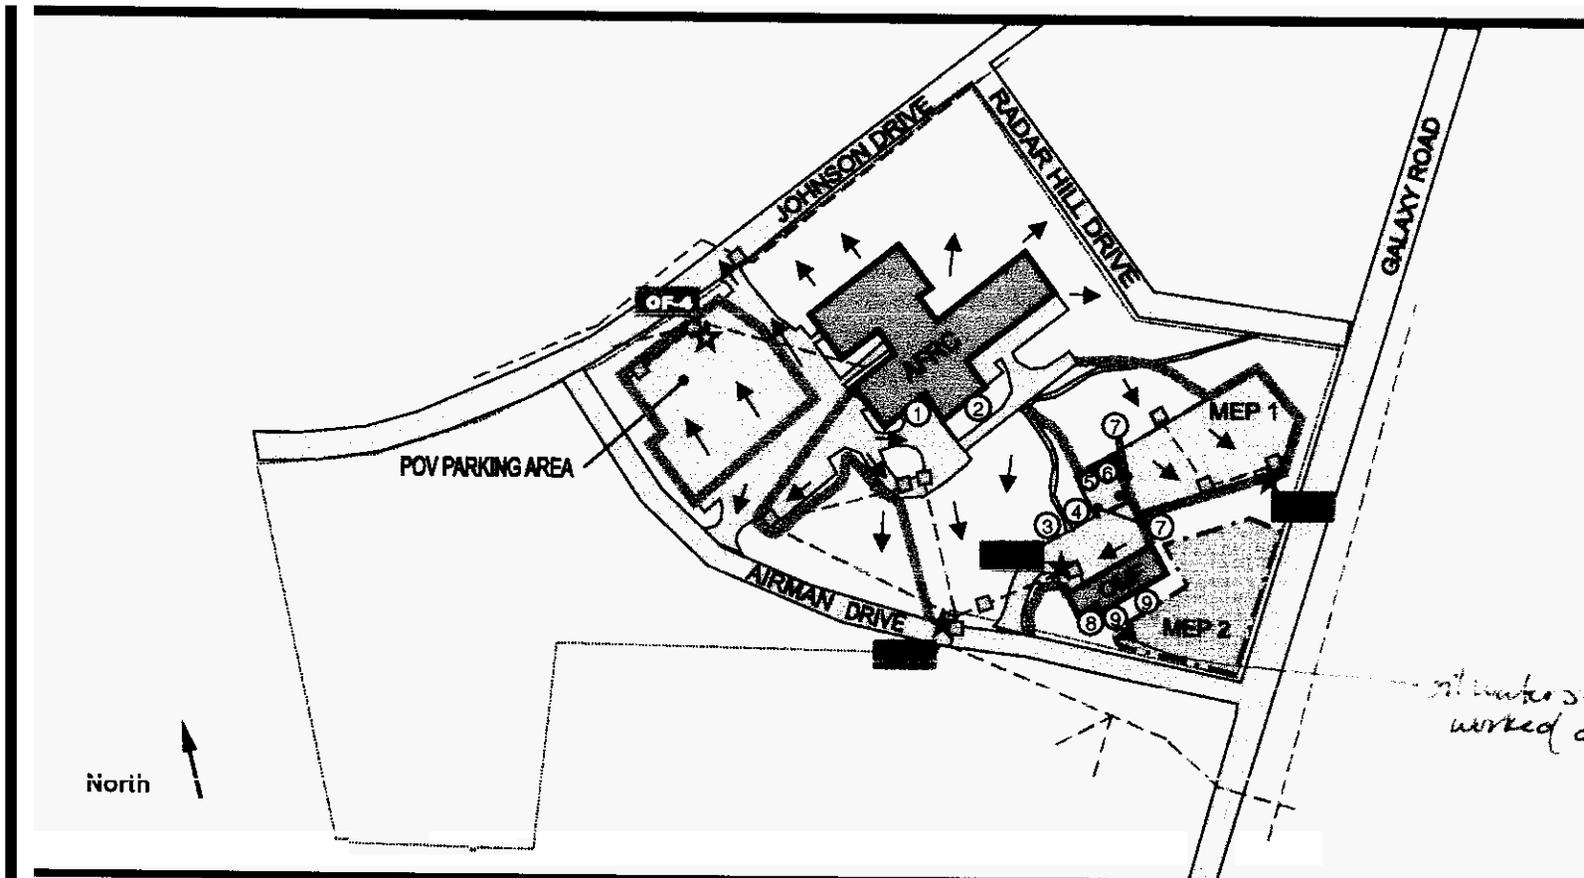

OF-2 is a storm drain north of the OMF (*PLATE 43*). Military vehicles waiting to be moved into the maintenance bays are temporarily parked in front of the OMF near this storm drain. Operator maintenance is performed in this parking area. Regulated activities within the drainage area of OF-2 include potential leaks from military vehicles temporarily parked in this area and potential spill during loading/unloading of PPMs into the OMF and the POL shed area (*PLATE 13*). This outfall also includes roof drainage from the OMF. Stormwater exiting the facility at OF-2 flows west and enters the storm-sewer system on *Airman Drive*. The storm-sewer system directs flow southeast to Galaxy Road and discharges into Willimanson Brook.

OF-3 is a storm drain northwest of the OMF on *Airman Drive* (*PLATE 44*). Most of the stormwater runoff exiting the facility at OF-3 is **from** the paved POV parking area south of the AFRC building and from the grass covered hill south of the AFRC. OF-3 is regulated because stormwater runoff entering the facility storm-sewer system at OF-2 flows past OF-3 before exiting the facility. Stormwater from OF-3 is directed southeast to Galaxy Road and discharges into Willimanson Brook.

OF-4 is a storm drain in the POV parking area west of the AFRC (*PLATE 45*). No regulated activities occur within the drainage area of OF-4. Most of the POV parking area that contributes flow to OF-4 can be seen in plate 2. Stormwater exiting the facility at OF-4 flows southwest along Johnson Drive and enters Willimanson Brook. Some overland flow from the eastern side of the POV parking area bypasses OF-4 and flows under the fence onto Johnson Drive. Some of this flow may enter the storm drain located on the southern side of Johnson Drive.

The Westover **Air** Force Base (AFB) SWP3 does not include the AFRC. Stormwater runoff from the AFRC enters storm-sewer systems that do not have a NPDES permit, according to the Environmental Engineering Group at Westover AFB.

3.0 Assessment-Continued

3.0 Assessment-Continued

3.3 STRUCTURES [NPDES.XI.P.2.b.(2)(a) & (b)]

Stormwater runoff at the Westover OMF collects in one of two storm drains in MEP 1 that direct flow into the storm-sewer system on Galaxy Road. **An** asphalt berm surrounds MEP 1, so all runoff in this **area** is directed into the storm-sewer system. The storm drain north of the OMF (OF-2) directs flow into the storm-sewer system on Aiman Drive (*PLATE 43*). The vehicle-wash rack north of the OMF (site **3**, *PLATE 6*) directs flow through an oil/water separator (site **4**, *PLATE 7*) into the sanitary-sewer system. The oil/water separator and storm drains were cleaned in June 1998, according to the facility coordinator. Several floor drains (*PLATE 33 shows one drain*) inside the OMF direct flow through one of two oil/water separators south of the OMF (site **9**, *PLATE 16*) into the sanitary-sewer system.

3.4 POTENTIALLY POLLUTING MATERIALS [NPDES.XI.P.2.b.(2)(b)]

Exposed potentially polluting materials (PPMs) include any hazardous materials that are exposed to precipitation and/or stormwater runoff (i.e., during storage, active **use**, or loading/unloading). A lack of cover and containment during loading/unloading or storage of PPMs commonly results in exposure to stormwater runoff. Both U.S. Army Reserve and U.S. Marine Corps maintenance personnel at the OMF should maintain an updated inventory tracking system for PPMs used by their unit at the facility. **An** electronic copy of the PPM inventory for each unit, in spreadsheet format, will be provided to maintenance personnel as part of this assessment. The inventory should be continuously updated and include: the locations of materials and approximate quantities on hand.

3.5 POTENTIAL SOURCES OF POLLUTANTS [NPDES.XI.P.2.b.(2)(e)]

An inventory of areas at the Westover OMF where industrial activities could potentially pollute stormwater runoff was compiled from facility plans, staff interviews, and field reconnaissance. PPMs, either during storage or loading and unloading, are the main source of pollution at this facility. The use of PPMs and generation of waste products are results of vehicle maintenance. Substantial vehicle fueling is not conducted at this facility.

The **U.S.** Army Reserve performs maintenance of vehicles and equipment inside the OMF within three service bays (*PLATE 32 shows the large maintenance bay*). Minor repairs are occasionally made to vehicles outside the OMF in the vehicle parking areas. Vehicle maintenance that involves the exchange of fluids is not conducted in the MEPs, according to the Motor Sergeant. The 287th Medical Company (DS) participates in the Army Oil Analysis Program operated through Fort Drum, New **York**.

The Army Reserve stores PPMs in a triple-bay POL shed on a paved **area** surrounded by a fence near MEP 1 (site **5**, *PLATES 8, 9, 10*). New PPMs are stored inside the eastern bay. The middle bay is **used** as a storage **area** for outdated PPMs such as paint. The western bay is used as a storage **area** for new 55-gallon **drums** and empty canisters.

The 25th Marines TOW Platoon performs vehicle maintenance within two service bays inside the OMF (*PLATE 31 shows one bay*). The Marine Corps store most new PPMs inside the OMF in one of two flammables storage cabinets (site 20, *PLATES 28, 29*) or in a corrosive storage cabinet in the battery room (site **14**, *PLATE 21*). Battery filling with a sulfuric acid electrolyte is performed in the battery room. Some new PPMs were observed on the floor of the OMF and battery room during the assessment. Materials stored inside the OMF are protected from precipitation and stormwater runoff during storage, however secondary containment should be provided for all PPMs stored either inside or outside the OMF. **A** single-bay POL shed is used for bulk storage of new PPMs (site **6**, *PLATE 11*).

3.0 Assessment-Continued

The Marine Corps store waste PPMs inside the OMF in one of two flammables storage cabinets (**sites 19, 20; PLATES 26, 27**). Used oil filters are drained and stored uncrushed in a metal bucket prior to disposal (**site 18, PLATE 25**).

The 287th Medical Company (DS) does not generate hazardous waste on a routine basis. Waste generated by the unit is given to the 25th Marines TOW Platoon for disposal. The Motor Transport Chief (Marine Corps) takes waste PPMs to hanger 5 on the Westover AFB for disposal about once a month. The unit generates about 5 gallons of waste oil per month, according to the Motor Transport Chief. The 25th Marines TOW Platoon follows the same hazardous-material regulations as those followed by Westover AFB personnel.

A 2,000-gallon underground-storage tank (UST) filled with no. 2 fuel oil is used to heat the OMF (**site 8, PLATE 15**). An 8,000-gallon UST is used to store fuel oil used to heat the AFRC (**site 2, PLATE 5**). Both USTs have the potential to impact surface water during the tank filling procedure. The tanks are tested yearly, according to the Facility Coordinator.

3.6 SIGNIFICANT SPILLS AND LEAKS [NPDES.XI.P.2.b.(2)(c)]

There have not been any significant (reportable) spills or leaks during the last 3 years at the Westover AFRC, according to the Army Reserve Facility Coordinator and the Marine Corps Motor Transport Chief.

3.7 NON-STORMWATER DISCHARGES [NPDES.XI.P.2.b.(3)(g)(i)]

Unauthorized connections discharging pollutants to stormwater runoff or inappropriate management practices result in non-stormwater discharges (NSWDs) to stormwater-sewer systems, open drainage ditches, and outfalls. Sources of unauthorized NSWDs must be identified and permitted, or eliminated, except for flows in compliance with a NPDES permit. Stormwater-pollution prevention measures should be adopted and implemented, where necessary, to minimize pollutants in these discharges.

OF-I, OF-2, and OF-3 (**PLATES 42 to 44**) were observed for NSWDs on July 22, 1999, as part of the Westover AFRC site assessment conducted by the USGS. Dry-weather discharges were not observed at any of these regulated outfalls. A NSWD certification is provided in the Appendix (table 6.0). The certification [NPDES.XI.P.2.b.(3)(g)(i)] **must** be signed by the Facility Coordinator/First Sergeant in accordance with the signatory-requirements section of the multi-sector general permit [NPDES.VI.G].

3.8 STORMWATER-MONITORING DATA [NPDES.XI.P.2.b.(2)(d)]

Stormwater sampling has not occurred at this facility, according to the Facility Coordinator. Sampling of stormwater, if required, should be conducted at regulated outfalls as mandated by the USEPA. Stormwater sampling and analysis **must** be performed by qualified individuals adhering to a specific quality-assurance/quality-control program. Stormwater monitoring currently is not required for vehicle-maintenance activities in USEPA-regulated states like Massachusetts and most states with NPDES permitting authority.

3.9 RISK SUMMARY [NPDES.XI.P.2.b.(2)(a) & (e)]

An initial assessment of areas at the Westover AFRC with a potential for pollution from stormwater runoff has been prepared as part of the SWP3. The assessment should be considered a "snapshot" in time and must be updated annually or more often, as necessary. The following narratives summarize conditions observed during the July 13 and 22, 1999, site assessment. Sites identified as having a potential for stormwater pollution are summarized in table 3.9. Locations of these sites are shown in figures 3.1a and 3.1b.

3.0 Assessment-Continued

ORGANIZATIONAL MAINTENANCE FACILITY – U.S. ARMY RESERVE

The 287th Medical Company (DS) performs operator and some organizational maintenance at three bays inside the OMF. One large bay (*PLATE 32*) and two small bays are available for the Army Reserve to perform vehicle maintenance in the Westover OMF. There is a floor drain in the large bay and a floor drain in the center of the two small bays (*PLATE 33*). Both floor drains direct flow through an oil/water separator south of the OMF (site 9, *PLATE 16*) into the sanitary-sewer system.

Military equipment serviced at the shop includes 2.5-ton cargo units, light utility vehicles, cargo trailers, and generators. Unit maintenance personnel perform all of the operator maintenance and about twenty percent of the organizational maintenance on vehicles operated by the 287th Medical Company (DS). Unit personnel usually perform organizational maintenance on vehicles operated by the 287th Medical Company (DS) at AMSA 72 (C) in Windsor Locks, Connecticut. Eighty percent of the organizational maintenance and all of the direct support maintenance on these vehicles is done by AMSA 72 (G).

Adequate workspace was noted in the maintenance bays. Spill socks were located on the mezzanine at the back of the large maintenance bay (site 21, *PLATE 34*). It is recommended that the spill equipment be moved near the maintenance bay doors to protect OF-2 from a spill or leak.

PPMs used for vehicle maintenance are currently being stored in the eastern bay of the triple door POL shed (site 5, *PLATE 10*). PPMs were observed without secondary containment in the large maintenance bay during the first day of the site assessment. A flammables storage cabinet or poly-spill pallet is needed to store PPMs inside the OMF. The PPMs were moved to the Army Reserve POL shed for safe storage. Waste PPMs were observed in several buckets in the back of a small maintenance bay (site 22, *PLATE 35*). The used motor oil needs to be disposed of as hazardous waste.

Two drip pans for use by the Army Reserve were observed during the site assessment. Approximately 10 percent of the vehicles stored at the facility should have drip pans available to control potential leaks. The Army Reserve has a sufficient number of drip pans at this time.

Material safety data sheets (MSDS) were not available for PPMs used by the Army Reserve. Spill-response procedure signs were not posted in the OMF. A recommended BMP is to post current spill-response procedure signs at all PPM storage and loading/unloading areas. It is recommended that current MSDS sheets be stored in a binder and mounted to the wall in the OMF.

An Installation Spill Contingency Plan (ISCP) was designed by the Army Reserve for this facility by combining a plan from the 94th Regional Support Command and a plan from the Westover AFB. The plan is about two to three years old, according to the Facility Coordinator. The Army Reserve has a hazardous-material/waste handling plan. The Motor Sergeant has had hazardous-material/waste handling training and is due for a yearly refresher. It is recommended that all military and civilian personnel have good housekeeping, emergency spill response, and stormwater training.

The OMF poses a moderate risk to surface waters of the State of Massachusetts. A spill inside the OMF or a leaking vehicle parked outside the maintenance bays (*PLATE 14*) could enter OF-2. Army Reserve personnel need to have spill equipment near this drain to shorten spill response time. PPMs should not be stored in the maintenance bays without secondary containment.

3.0 Assessment-Continued

ORGANIZATIONAL MAINTENANCE FACILITY – U.S. MARINE CORPS

The 25th Marines TOW Platoon performs maintenance at two service bays inside the OMF (PLATE 31). There are two floor drains in the maintenance area that direct flow through an oil/water separator south of the OMF (site 9, PLATE 16) into the sanitary-sewersystem.

Military equipment serviced at the shop includes high mobility multi-purpose wheeled vehicles (HMMWVs), 5-ton cargo units, light utility vehicles, and a trailer. Unit personnel perform first echelon maintenance on vehicles operated by 25th Marines TOW Platoon. Second or third echelon maintenance is performed in Worcester, Massachusetts, at the Marine Headquarters or a contact team travels to the Westover OMF to perform vehicle maintenance.

Neat, orderly conditions and adequate workspace were noted in the maintenance bays. A spill control center (barrel on wheels) was observed in the southeast corner of the maintenance area, (site 16, PLATE 23). Absorbent pads were observed in the mezzanine (site 13, PLATE 20). Crates of spill equipment for vehicles were observed in one of the maintenance bays (site 11, PLATE 18). Three bags of safety absorbent were observed on top of flammables storage cabinet no. 1 (site 20, PLATE 30).

PPMs used for vehicle maintenance are stored in the OMF in one of two flammables storage cabinets (site 20, PLATES 28, 29). Bulk PPM storage occurs in a singledoor POL shed north of the OMF (site 6, PLATE 11). Flammables storage cabinet no. 1 is equipped with a spill containment tray [PLATE 29]. Cabinet no. 2 is an older model storage cabinet that does not provide secondary containment (PLATE 28). PPMs stored inside the OMF are fully protected from precipitation and stormwater runoff. It is recommended that a flammables storage cabinet that provides secondary containment be requisitioned to replace cabinet no. 2.

Waste PPMs are stored in one of two flammables storage cabinets prior to disposal at hanger 5 on the Westover AFB (sites 19, 20; PLATES 26, 27). Drums were stored neatly and were well labeled in cabinets that provide secondary containment. The Marine Corps has two drip pans available in the drip pan storage area (site 17, PLATE 24). The Marines routinely use mats underneath vehicles to contain leaks, so they can be easily cleaned up with dry sweep. A berm is created by raising the sides of the mat with dirt or by digging down in the center of the mat.

New PPMs were observed stored directly on the floor in the maintenance shop without secondary containment (sites 10, 12; PLATES 17, 19). Five-gallon cans of paint were also observed stored directly on the floor in the battery room. It is recommended that all PPMs in the shop be stored with secondary containment. A poly-spill pallet observed in the mezzanine during the assessment could be moved to the maintenance area and used as a temporary storage area for waste PPMs prior to disposal (site 15, PLATE 22). The flammables storage cabinets could then be used to store new PPMs.

Material safety data sheets (MSDS) are stored in a binder in the shop office. Spill-response procedure signs were not posted in the OMF. A recommended BMP is to post current spill-response procedures signs at PPM storage and loading/unloading area,.

The maintenance staff attends hazardous-materials training every year, according to unit personnel. The Motor Transport Chief has a computerized hazardous-waste tracking system and a hazardous-materials inventor). Environmental documentation was not observed during the assessment. It is recommended that the Marine Corps develop hazardous-materials standard operating procedures (SOPs) that include a spill contingency plan and hazardous-material waste handling plan.

3.0 Assessment-Continued

The Marine Corps has two flammables storage cabinets at the AFRC loading dock (site 1, PLATE 4). These cabinets contain lithium batteries and cans of spray paint. It is recommended that no liquid PPMs be stored in these cabinets unless they are moved indoors to protect them from precipitation.

The OMF poses a moderate risk to surface waters of the State of Massachusetts. PPMs stored without secondary containment, especially the 5-gallon container of diesel fuel stored by the bay door, have the potential to adversely affect surface water. Adequate spill-response equipment is located in the building. The most significant threat to stormwater from this area would be an undetected leak in the diesel container that entered OF-2.

MILITARY EQUIPMENT PARK NO. 1

The Military Equipment Park used by the U.S. Army Reserve is a paved, bermed area northeast of the OMF identified as MEP 1 (PLATES 37, 38). The 287th Medical Company (DS) uses MEP 1 for storage of about 26 military vehicles and pieces of equipment. The vehicles were parked in a neat and orderly manner. A walk-around-visual inspection for leaks is performed about two to three times per week, according the Facility Coordinator. The vehicle operators perform a technical inspection, preventive maintenance checks and services (PMCS), on drill weekends.

The storm drain north of MEP 1 (PLATE 36) collects surface runoff from the grass area between the AFRC and MEP 1 and directs the runoff into the storm-sewer system that runs through MEP 1. A storm drain in the southeastern corner of the parking area (OF-1) was covered with pine needles and debris at the time of the assessment (PLATE 42). It is recommended that the debris be removed from this area and that all of the storm drains at the facility have debris removed from them.

Two conexes were observed in the northwestern corner of MEP 1 (site 7). One conex contained stove parts, the other conex was empty. No PPMs were observed in either conex during the site assessment.

MEP 1 poses a low risk to surface waters of the State of Massachusetts. **The** most significant threat to surface water from this area would be an undetected **leak** from a military vehicle **parked** in this area.

MILITARY EQUIPMENT PARK NO. 2

The Military Equipment Park used by the U.S. Maine Corps is a fenced, unpaved area at the corner of Galaxy Road and Airman Drive. This weeds/gravel parking area has been identified as MEP 2 (PLATES 39, 40, 41). The 25th Marines TOW Platoon uses MEP 2 for storage of about 35 military vehicles and pieces of equipment. The vehicles were parked in a neat and orderly manner. Active duty personnel perform preventive maintenance inspections every day during the week. Reservists perform inspections on drill weekends once a month.

Stormwater from the grass area south and east of the OMF runs into MEP 2. POL staining was observed in MEP 2 (PLATE 41). Minor staining from a POL leak is easy to clean with dry sweep on a paved surface. Clean **up** of a leak in a dirt area is costly because the dirt surrounding the leak must also be disposed of as hazardous waste. It is recommended that MEP 2 be paved and bermed so that an undetected leak can be most cost efficiently controlled.

MEP 1 poses a low risk to surface waters of the State of Massachusetts. POL **leaks** into the soil under the gravel surface of the parking area are a groundwater concern. Groundwater contamination may enter Willimansoon Brook through the groundwater/surface-water interface.

3.0 Assessment-Continued

PETROLEUM, OIL, AND LUBRICANTS SHED AREA

Two POL sheds were observed inside a paved, fenced area west of MEP I. The triple-bay POL shed is used by the Army Reserve to store empty drums, outdated PPMs, and new PPMs (site **5**, *PLATES 8, 9, 10*). The Marine Corps uses the single-bay POL shed as a bulk storage area for new PPMs (site **6**, *PLATE 11*). It is recommended that the 287th Medical Company (DS) properly dispose of all outdated PPMs stored in the middle bay of the Army Reserve POL shed.

POL sheds protect stored chemicals from precipitation and stormwater runoff. However, PPMs have the potential to be stormwater pollutants as they are loaded/unloaded at the shed doors. A spill in the area of sites 5 and 6 will drain toward the OMF and may enter OF-2 if not quickly contained. It is recommended that a poly-spill barrel be stored outdoors near the POL shed area and MEP 1.

Two conexes were observed in the POL shed area (site **7**, *PLATE 13*). The conexes were used as storage areas for tents, tent poles and parts, and camouflage netting. No PPMs were observed in either conex. A unit that is no longer stationed at this facility left a supply of tent poles, pallets, and empty 55-gallon drums (PLATE 12). It is recommended that the drums be stored on the pallets and that they be covered with a tarp to prevent exposure to precipitation and stormwater runoff. These supplies could be disposed of properly if they are no longer useful to the 287th Medical Company (DS)

The POL sheds area poses a moderate risk to surface waters of the State of Massachusetts because no spill equipment is located in this area. Disposal of the excess equipment left at the facility would make access to the POL sheds easier and would minimize the chance of a spill during loading/unloading.

WASH RACK

The vehicle-wash rack at the Westover AFRC is north of the OMF (site **3**, *PLATE 6*). Water entering the wash-rack drain is directed through an oil/water separator into the sanitary-sewer system (site **4**, *PLATE 7*). The vehicle-wash rack is not used by the Army Reserve, according to the Facility Coordinator. The Marine Corps rinses their vehicles when slightly *dirty* and steam cleans them when they are very dirty at the vehicle-wash rack.

Drums of sand were removed from the oil/water separator when it was cleaned in June 1998. Sand enters the separator through the wash-rack drain. Precipitation and vehicle washing move sand into the separator. It is recommended that the oil/water separator be inspected and cleaned yearly so it functions at its maximum capacity.

The wash-rack area poses a low risk to surface waters of the State of Massachusetts because it drains into the sanitary-sewer system. The wash-rack drainage system is currently exposed to precipitation because it is not covered.

Handwritten note: *Drums of sand*

3.0 Assessment-Continued

Table 3.9 – Risk summary.

Site map code	Location	Regulated activity	Potentially polluting materials	Outfall/Receiving waters	Exposure type ¹	Rating/Reason ²
1	South of AFRC	PPM storage, loading	Batteries/spray paint	OF-3/Willimanson Brook	B, E	Low / c, d, e, f
2	South of AFRC	PPM storage, loading	Fuel oil	None/Groundwater	E	Low / h
3	North of OMF	Vehicle washing	POL residue	None/Sanitary sewer	G	Low / c, g
4	North of OMF	PPM storage	Used POL	None/Sanitary sewer	D	Low / g
5	West of MEP 1	PPM storage	New/outdated POL	OF-2/Willimanson Brook	E	Moderate / e, h
6	West of MEP 1	PPM storage	used POL	OF-2/Willimanson Brook	E	Moderate / e, h
8	South of OMF	PPM storage, loading	Fuel oil	None/Groundwater	E	Low / h
10	OMF	PPM storage	New POL	OF-2/Willimanson Brook	H	Moderate / d, f
12	OMF	PPM storage	New POL	None/Sanitary sewer	A	Low / d, g
19, 20	OMF	PPM storage, loading	New/used POL	None/Sanitary sewer	A	Low / h

3.0 Assessment-Continued

Table 3.9–Continued.

Site map code	Location	Regulated activity	Potentially polluting materials	Outfall/Receiving waters	Exposure type ¹	Rating/Reason ²
22	OMF	PPM temporary storage	Used POL	None/Sanitary sewer	A	Low / d, e, g
MEP2	South of OMF	Military vehicle parking	POL leak	None/Groundwater	H	Low / g

¹Exposure type:

- A No exposure to precipitation or stormwater runoff
- B ~~Direct~~ exposure to precipitation due to ~~lack~~ of covering during storage
- C Direct exposure to stormwater runoff due to lack of containment during storage.
- D Some indirect exposure to precipitation due to wash rack drainage **system**
- E ~~Direct~~ exposure to precipitation and runoff due to ~~spills/leaks~~ during material transfer.
- F ~~Direct~~ exposure of wash rack ~~drainage~~ system to storm runoff due to lack of berms.
- G Direct ~~exposure~~ of wash rack drainage system to precipitation due to lack of covering.
- H Direct exposure to precipitation and stormwater runoff due to undetected ~~leak~~ during storage.

²Rating/Reason key:

- a Lack of preventive maintenance and visual **inspection** program
- b Lack of containment preventing exposure to stormwater runoff.
- c Lack of covering ~~preventing~~ exposure to precipitation.
- d Lack of **employee** training and/or awareness.
- e Lack of spill **kits**, drip pans, sorbant, and/or ~~other~~ spill equipment.
- f Proximity to storm-drain inlet or other conveyance.
- g Not a point-source discharge to surface waters of the State.
- h Potential for spills/leaks into exposed areas during material transfer.

4.0 BEST MANAGEMENT PRACTICES PLAN [NPDES.XI.P.2.b.(3)]

Best Management Practices are measures and controls that can reduce potential stormwater pollution from industrial-activity pollutant sources. These BMPs are classified as "*baseline*" or "*advanced*" and they may be either inexpensive or costly to implement. Baseline BMPs include: inspection programs and a contingency plan that attempts to identify and eliminate conditions and practices that could cause stormwater pollution. Advanced BMPs are techniques, equipment, or structures that eliminate contact between stormwater runoff and PPMs.

In the following sections, foundations are established for a BMPs program at the Westover AFRC. Baseline and advanced BMPs necessary for the implementation of the facility stormwater program are discussed and listed in tables 4.0a and 4.0b. The stormwater inspection checklist (table 5.1b) should be used to monitor potential problem and to select BMPs.

4.1 BASELINE BEST MANAGEMENT PRACTICES

Baseline BMPs are relatively simple inspection programs and contingency plans that are implemented at a facility. The Motor Sergeant/Motor Transport Chief will perform monthly stormwater inspections. The 94th RSC is responsible for updating the spill plan, ensuring that unit personnel receive environmental training, and conducting an annual compliance inspection of the facility. The following baseline programs are discussed briefly in this chapter and are included in the stormwater inspection checklist provided in table 5.1b.

4.1.1 Good Housekeeping [NPDES.XI.P.2.b.(3)(a)]

Good housekeeping addresses cleanliness and orderliness of work and storage areas. Practicality guides the appropriate implementation of good-housekeeping practices.

4.1.2 Preventive Maintenance [NPDES.XI.P.2.b.(3)(b)]

Preventive maintenance involves an inspection of all vehicles and equipment for conditions that could lead to leaks or spills of PPMs. A technical inspection for fluid **leaks** or drips should be done for all incoming vehicles and equipment. Vehicles and equipment stored at the facility should be inspected daily for fluid leaks and drips. Maintenance equipment, oil/water separators, storage tanks and drums, pipes, and pumps should be included in the technical inspection.

4.1.3 Spill Prevention and Response [NPDES.XI.P.2.b.(3)(c)]

The facility spill plan should be reviewed and revised by the 94th RSC for the Westover AFRC. The Motor Sergeant/Motor Transport Chief **has** the responsibility to serve as emergency coordinator in the event of a spill. The Facility Coordinator/First Sergeant should be designated as emergency-response spill coordinator at the facility when the Motor Sergeant/Motor Transport Chief is not present. **The** Motor Sergeant/Motor Transport Chief (or alternate) have the responsibility to ensure the spill is immediately contained, proper spill reporting procedures are followed, and the 94th RSC is immediately informed.

4.0 Best Management Practices Plan-Continued

4.1.4 Visual Inspections [NPDES.XI.P.2.b.(3)(d)]

A formal visual-inspection program is used to ensure that good housekeeping and preventive maintenance are actively practiced, and that a spill plan and spill-containment equipment are readily available at the facility. The Motor Sergeant/Motor Transport Chief should conduct a monthly visual inspection of the motor pool using the stormwater-inspection checklist. The 94th RSC should perform annual compliance inspections using the stormwater-inspection checklist.

4.1.5 Sediment and Erosion Control [NPDES.XI.P.2.b.(3)(h)]

The USEPA Multi-Sector General Permit requires identification of areas having a high potential for significant soil erosion and selection of measures (BMPs) to mitigate soil loss. For information on such areas, refer to section 3.9. The area near the storm drain north of MEP I is devoid of grass or vegetation and is an erosion issue at this facility. This area should be re-seeded so that soil is not washed into the storm drain during heavy downpours.

4.1.6 Environmental Training [NPDES.XI.P.2.b.(3)(e)]

Headquarters, U.S. Army Reserve Command, has developed a video-based stormwater-training package. Annual stormwater training is mandated by Deputy Chief of Staff, Operations (Training Division) [DCSOPS (T)] for all reservists assigned to a facility with a stormwater permit. All civilian personnel who work within regulated areas also are required to attend this training. The training, using several videos supplied by the U.S. Army Reserve Command, can be implemented in two or more sessions during the year.

4.2 ADVANCED BEST MANAGEMENT PRACTICES

Advanced BMPs are techniques, equipment, structures, or construction practices that prevent hazardous materials or wastes from reaching the environment in stormwater runoff. All Army Reserve maintenance facilities employ advanced **BMPs**. Implementation of new advanced BMPs or maintenance and upkeep of existing advanced BMPs usually requires requisitions, work orders, or self-help initiatives. Identification, implementation, and upkeep of advanced BMPs involves communication among the Facility Coordinator/First Sergeant, Motor Sergeant/Motor Transport Chief, shop personnel, senior officers, and 94th RSC staff. The Facility Coordinator/First Sergeant has the responsibility to work with OMF, unit, and 94th RSC personnel to identify necessary advanced BMPs and provide proper maintenance and upkeep for existing advanced **BMPs**. Also, the Facility Coordinator/First Sergeant has the responsibility to inform senior officers of advanced BMP needs, and to submit and follow up on requisitions and work orders for those BMPs selected.

Tables 4.0a and 4.0b detail the status of the BMP program at the facility. Baseline and advanced BMPs can be prioritized according to need and scheduled by the PPT. "Recommended" BMPs in tables 4.0a and 4.0b should be endorsed by the PPT as goals for 2000. The Facility Coordinator/First Sergeant should initial and date the block indicating that the recommended BMP is accepted and is being implemented.

4.0 Best Management Practices Plan-Continued

Table 4.0a—Best Management Practices for the U.S. Army Reserves.

Best management practice (BMP)	BMP type	Implemented	Recommend improvement	Implemented by	Implementation date
Keep work areas and outside areas clean, free of easily spilled materials, and free of sediment and loose soil	GH		X		
Ensure that maintenance buildings and PPM storage buildings are in good condition	GH	X			
Perform maintenance at authorized areas	GH	X			
Clean spilled materials with dry sweep or rags, not with water	GH	X			
Enforce proper handling, storage, disposal, and labeling of new and used PPMs	GH		X		
Maintain updated MSDS sheets and PPMs inventory	GH		X		
Post good-housekeeping visual aids at the motor pool	GH		X		
Formally train military and civilian maintenance personnel in good-housekeeping practices	GH/TG		X		
Provide technical inspection for all incoming and parked vehicles and equipment with particular emphasis on fluid leaks	PM/VI	X			
Regularly service storm-drain inlets, pipes, and other conveyances	PM		X		
Ensure that updated spill plan, emergency coordinator, and spill equipment are available at the facility during working hours	SPR		X		
In the event of a significant spill or leak during off-duty hours, the designated spill coordinator should refer to the spill plan	SPR		X		
Provide formal training in emergency spill response to all military and civilian maintenance personnel	SPR/TG		X		
Ensure that outdoor-storage structures provide secondary containment and prevent contact between PPMs and stormwater	SPR	X			
Conduct a monthly visual inspection of the motor pool using the stormwater-inspection checklist. Sign, date, and retain with SWP3	VI		X		
Identify conditions that could cause stormwater pollution and report potential problems to the 94 th RSC	VI	X			
Perform an annual stormwater-compliance inspection	VI		X		
Provide stormwater training for all military and civilian maintenance personnel	TG		X

5.0 IMPLEMENTATION [NPDES.XI.P.2.b.(4)]

This section establishes inspection and record-keeping programs that will bring the facility into compliance. Included in this chapter are a guide for implementing a stormwater program, a stormwater-log sheet for record keeping, a stormwater-inspection checklist to be used when performing monthly and annual stormwater inspections, and an annual compliance schedule. Table 5.0 presents key elements required to implement and evaluate the stormwater-management program, and includes columns for approval and scheduling of such activities by senior officials.

Table 5.0–Key elements to implement and evaluate the stormwater-management program.

Elements to implement stormwater-management program	By	Date
Assign top priority to: (1) correcting problems identified during the initial site assessment; and (2) establishing a stormwater-inspection and personnel-training program.		
Record significant stormwater-management activities on the stormwater-log sheet.		
The Motor Sergeant/Motor Transport Chief will perform monthly inspections. Any problems identified will be reported to the Facility Coordinator/First Sergeant for corrective action. If the Facility Coordinator/First Sergeant cannot correct the problem, recommendations for corrective actions will be made to the 94 th RSC.		
Monthly inspection checklists will be reviewed, signed, and dated by the Facility Coordinator/First Sergeant, and filed by the Motor Sergeant/Motor Transport Chief for future reference by compliance inspectors.		
The 94 th RSC will perform periodic stormwater-inspection reviews. Recommended corrective actions and employee training needs should be discussed.		
The Facility Coordinator/First Sergeant should discuss equipment, construction, and training needs with the Motor Sergeant/Motor Transport Chief, senior officers and the 94 th RSC. The Facility Coordinator/First Sergeant should submit requisitions and work orders through proper channels.		
Employee training should be conducted.		
Advanced BMPs should be implemented.		
Personnel from the 94 th RSC will conduct the annual compliance evaluations for the stormwater-management program and stormwater-plan reviews.		

5.0 Implementation-Continuen'

5.1 STORMWATER-LOG SHEET AND -INSPECTION CHECKLIST [NPDES.XI.P.2.b.(4)(c)]

The stormwater-log sheet (table 5.1a) and stormwater-inspection checklist (table 5.1b) for motor pool operations are provided on the following pages. The log sheet and checklist are a permanent record of stormwater-management activities conducted at this facility. Items such as stormwater inspections, PPM spills, or activities related to implementation and maintenance of BMPs should be **recorded** on the log sheet. The inspection checklist is designed to reinforce the existing BMP program by assessing the effectiveness of implemented measures and controls. Regularly (monthly) updating logs and checklists will aid the facility in tracking pollutant sources, **risks**, and BMPs. The original documents should be **signed** and dated, and kept with the SWP3 at the facility for future reference during, plan revisions or inquiries by 94'' RSC, State, or Federal inspectors.

5.0 Implementation-Continued

Table 5.1b—Stormwater-inspection checklist.

Unit name:		Building name:		Date:
Problems noted:				
Inspector's name:			Signature:	
Yes	No	Type	Inspection Item	
			Do you see any evidence of recently spilled materials, either solid or liquid?	
			Do you see any evidence of illegal dumping in storm-sewer system or storm drains?	
			Are PPMs exposed to precipitation or stormwater runoff?	
			Are drums, PPM storage structures, and secondary-containment units secure and properly labeled?	
			Are waste PPMs generated at the OMF properly collected and disposal of?	
			Are vehicles and equipment stored outdoors free of excessive mud and dirt?	
			Do you see excess trash, unswept or cluttered work areas, or materials that can be easily spilled?	
			Are there spots, pools, or other traces of PPMs on the ground?	
			Do you see any leaking vehicles, drums, tanks, dumpsters, or other equipment?	
			Does standing water have an oil sheen or discoloration?	
			Is vehicle/equipment washing or steam cleaning performed at any area other than the vehicle-wash rack?	
			Is the vehicle-wash rack operating properly?	
			Is an updated spill plan or SOP posted on the shop bulletin board?	
			Is spill-containment equipment readily accessible?	
			Are monthly visual inspections performed and documented?	
			Does stormwater runoff enter and cause problems inside shop and storage buildings?	
			Is there any active soil erosion at the motor pool?	
			Are there areas of standing water at the motor pool?	
			Are any non-stormwater discharges entering the storm-sewer system or drainage ditches?	
			Do outdoor PPM storage structures prevent contact with precipitation or stormwater runoff?	
			Are secondary-containment units in use at new and used PPM storage areas?	
			Are drip pans in use at the motor pool? Estimated percentage of vehicles with drip pans: _____%.	
			Are conex boxes or milvans used to store new or used PPMs at this motor pool? If yes, please give the number of conex boxes or milvans in use: _____	
			Are visual ai _____	
			Is environm _____

5.0 Implementation-Continued

5.2 ANNUAL COMPLIANCE INSPECTION [NPDES.XI.P.2.b.(4)(a)]

The SWP3 should be updated annually or more often, as required. The 94" RSC is charged with conducting compliance evaluations and updating the plan. Major tasks include (1) reviewing updated site information (including stormwater-log sheets and stormwater-inspection forms), (2) reinspecting industrial-activity and pollutant-source areas and outfalls, (3) updating information about those areas and the PPMs inventory, (4) conducting non-stormwater-discharge inspections of outfalls, (5) reevaluating the use of BMPs and recommending additional controls (if necessary), and (6) convening the PPT to review stormwater issues and problems. The compliance update also allows the PPT to assess and update training needs. Table 5.2 provides information on conducting the evaluations

Table 5.2—Annual compliance schedule.

Compliance element	Conducted by	Start date	Completion date
Review monthly stormwater-inspection checklists completed by the Motor Sergeant/Motor Transport Chief			
Review site assessment in SWP3 and update as necessary (outfalls, sources, PPMs, site map)			
Review implementation status of BMPs in SWP3 and update as necessary			
Based on updates to implemented BMPs, update recommended BMPs			
Review and update regulatory information in the SWP3 if necessary			
Conduct NSWD assessment and certification of regulated outfalls			
Conduct stormwater sampling of regulated outfalls if required. (Consult USEPA and USEPA Multi-Sector General Permit for information.)			
Complete report of compliance findings and sample results, and file

2.0 INTRODUCTION

Nobis Engineering, Inc. (*Nobis*) has prepared this Closure Report summarizing the results of the underground storage tank (UST) removal activities conducted at the U.S. Armed Forces Reserve (USAFR) Center Westover Air Force Base Building 5550 and Building 5551 in Chicopee, Massachusetts. The UST removal activities were performed under Delivery Order No. 0003 of U.S. Army Corps of Engineers (USACE) New England District Contract No. DACA33-98-D-0004. This work was conducted in accordance with *Nobis*' approved Work Plan dated September 22, 2000, USACE May 10, 2000 (refer to contract modification no.07) Statement of Work (SOW), and USACE UST Removal Technical Specification No. 02115. A locus plan showing the approximate site location is included as Figure 1. A site plan depicting the location of the former on-site USTs and other pertinent site information is included as Figure 2. Soil sample location schematics are included as Figures 3A and 3B and pertinent site photographs are included as Figure 4A and 4B.

2.1 Site Background Information

The site is known as the USAFR Center Westover Air Force Base located in Chicopee, MA. Building 5550 is used as the Armed Forces Reserve (AFR) Center and Building 5551 is the Organizational Maintenance Shop (OMS). The remaining portions of the site consist of paved and landscaped areas.

One 8,000-gallon, single-walled, steel UST was located on the east side of Building 5551. Surficial conditions adjacent to the 8,000-gallon UST include both paved and landscaped areas. One 2,000-gallon, single-walled, steel UST was located behind the OMS Building 5550 in a patchy grass-covered area. Surficial conditions in the vicinity of the 2,000-gallon UST include landscaped areas. The 8,000-gallon UST was reportedly installed in 1969, and the 2,000-gallon UST was reportedly installed in 1977.

3.0 SCOPE OF SERVICES

The objective of this project was to remove and dispose of one 8,000-gallon #2 fuel oil UST, one 2,000-gallon #2 fuel oil UST, the contents of the tanks, and miscellaneous debris associated with the excavation and removal. Soils encountered during the UST excavations were screened in the field for the presence of hydrocarbon contamination with a photoionization (PID) detector. Details of the field screening may be found in Section 6.0. The work described herein was based on USACE's SOW dated May 10, 2000 and includes the following remedial tasks:

- Mobilization/Demobilization Activities.
- UST and associated debris removal and disposal
- Confirmatory sampling and analysis.
- Backfill and site restoration.
- Preparation of UST closure report.

May 31, 2001

4.0 REGULATORY REQUIREMENTS

In addition to the Federal regulations pertaining to UST removal actions and OSHA requirements that are described in the approved Work Plan, UST removal activities were performed in accordance with the following State and local regulatory requirements:

4.1 State and Local Requirements

Nobis, and our subcontractor Resource Control conducted UST removal actions in accordance with the *Commonwealth of Massachusetts Underground Storage Tank Closure Assessment Manual*. The Chicopee Fire Department (CFD) was notified approximately one-week prior to the removal of the UST. A permit was obtained from the CFD for the UST removal and transportation to a approved UST disposal yard. A copy of the permit is included in Appendix A.

Sampling and field screening of soil and groundwater, as described in the Sampling and Analysis Plan (SAP), dated September 22, 2000, was performed in accordance with the above mentioned document.

4.2 Soil and Groundwater Reportable Categories

The Massachusetts Contingency Plan (MCP), dated October 1997, was reviewed to determine the applicable evaluation method and soil and groundwater standards. Numerical standards are established in the MCP for all contaminants on the site. No site-specific conditions exist which would require the use of Method 2 or Method 3 evaluations. The MCP Method 1 Criteria, therefore, applies to the USAFR Center Westover Air Force Base site.

Based on initial review, applicable criteria for the site is Reportable Concentrations for Soil (RCS-2). Analytical results of soil samples collected during the UST closure activities did not indicate target parameters at concentrations exceeding laboratory detection limits. Laboratory detection limits were less than the more stringent RCS-1 standards.

5.0 UST REMOVAL ACTIVITIES

On November 2, 2000, one 8,1300-gallon #2 fuel oil UST and one 2,000-gallon #2 fuel oil UST were removed at the subject site by Resource, of Weymouth, Massachusetts, as a subcontractor to *Nobis*. Prior to removal approximately 500-gallons of product was removed from the 8,000-gallon UST and no product was removed from the 2,000-gallon UST. Approximately 180-gallons of wash water was used to clean the 8,000 and 2,000-gallon USTs, for a total of 680 gallons of product removed from the site. The product was transported for disposal by New England Disposal Technology (NEDT) of Readville, Massachusetts to Environmental Compliance Corp. of Stoughton, Massachusetts for disposal (Refer to Appendix A for a copy of the Hazardous Waste Manifest).

May 31, 2001

5.1 8,000-Gallon UST

In order to remove the UST, Resource excavated soils within an area approximately 35 feet long by 17 feet wide, and extending to a depth of approximately 9 feet below the ground surface (bgs). The feed lines running from the UST to the building were removed and the holes to the building were sealed with hydraulic cement.

Soils encountered during the excavation activities were primarily a finely graded fine to medium native sand and gravel backfill. Groundwater or bedrock was not encountered during the UST excavation. Excavated soils generated during the removal of the UST were temporarily stockpiled adjacent to the excavation.

The single-walled, steel UST was observed to be in good condition with no evidence of holes or damage other than incidental damage incurred during removal. The length of the tank was approximately 336 inches (28 feet) and the diameter was 84 inches (7 feet). The UST was situated on a concrete pad, which was not removed during the excavation of the UST. The UST fuel lines were cut and filled with hydraulic cement.

The UST was cleaned in ground, removed, and placed on a flat bed for transport. James G. Grant Recycling transported the resulting UST and debris to the Grant Recycling Readville, Massachusetts on November 2, 2000. A copy of the UST receipt is included in Appendix A.

Based on field screening results (refer to Section 6.0) and site observations, the excavation was backfilled with the temporarily stockpiled material and imported processed gravel.

Interim restoration was limited to backfilling with processed gravel and compaction. Final restoration activities including loaming and seeding were completed on November 3, 2000.

5.2 2,000-Gallon UST

Prior to removal of the 2,000-gallon UST, Resource excavated soils within an area approximately 20 feet 8 inches long by 10 feet 9 inches wide, and extending to a depth of approximately 8 feet bgs. The feed lines running from the UST to the building were removed and the holes to the building were sealed with hydraulic cement.

Soils encountered during the excavation activities were primarily a fine to medium graded native sand and gravel backfill. Groundwater or bedrock was not encountered during the UST excavation. Excavated soils generated during the removal of the UST were temporarily stockpiled adjacent to the excavation.

The single-walled, steel UST was observed to be in good condition with no evidence of holes or damage other than slight scrapes on the outer wall caused during

excavation. The length of the tank was approximately 144 inches (12 feet) and the diameter was 64 inches (5 feet 4 inches).

The UST was cleaned in ground, removed and placed on a flat bed for transport. The UST was cleaned by flushing water into UST and pumping the oil and water into a vacuum truck for disposal. James G. Grant Recycling transported the resulting tank and debris to the Grant Recycling in Reaclville, Massachusetts on November 2, 2000. A copy of the tank receipt is included in Appendix A.

Based on field screening results (refer to Section 6.0) and site observations, the excavation was backfilled with the temporarily stockpiled material and imported processed gravel.

Interim restoration was limited to backfilling with processed gravel and compaction. Final restoration activities including loaming and seeding were completed on November 3, 2000.

6.0 FIELD SCREENING RESULTS

A Photovac MicroTIP PID equipped with a 10.6 eV bulb was used to screen the temporary soil stockpile, ambient air over the excavation, the breathing zone, and other materials encountered during the removal activities for total volatile organic compounds (VOCs). Additionally, soil samples collected for laboratory analysis were screened in the field. Refer to Section 7.0 for descriptions of the analytical sample locations. The MicroTIP PID responds readily to most VOCs but does not register methane or natural components of air such as oxygen, nitrogen, or carbon dioxide. The MicroTIP PID has a detection limit of approximately 1 part per million (ppm) by volume, referenced to an isobutylene-in-air standard. In accordance with *Nobis'* approved Work Plan, an action level of 25 ppm, was used for the purpose of segregating "clean" soil from contaminated soil.

Field screening results are summarized in Table 1 and screening results of analytical sample locations are summarized in Table 2. Field screening procedures are described in Appendix B.

6.1 8,000-Gallon UST Excavation

PID screening results of soils encountered during the 8,000-gallon UST removal activities were all below the action level of 25 ppm. PID readings of the temporary stockpile were 0 ppm. The PID readings of the soil samples collected for laboratory analysis ranged from 0 to 4.1 ppm. The highest PID reading was recorded for sample 8KW collected at a depth of four to six feet bgs. No staining or petroleum odors were noted during the excavation of the 2,000-gallon UST.

Based on screening results and observations, the excavation was backfilled with the temporary soil stockpile material and processed gravel, after collection of applicable samples for laboratory analysis.

May 31, 2001

6.2 2,000-Gallon UST Excavation

PID screening results of soils encountered during the 2,000-gallon UST removal activities were all below the action level of 25 ppm. PID readings of the temporary stockpile were 0 ppm. The PID readings of the soil samples collected for laboratory analysis ranged from 0 to 2.7 ppm. The highest PID reading was recorded for sample 2KE collected at a depth of four to six feet bgs. No staining or petroleum odors were noted during the excavation of the 2,000-gallon UST.

Based on screening results and observation, the excavation was backfilled with the temporary soil stockpile material and processed gravel, after collection of applicable samples for laboratory analysis.

7.0 SAMPLE COLLECTION AND ANALYSIS

Confirmatory soil samples were collected from the UST excavations based on field conditions and in accordance with the approved SAP. Soil samples were designated 2K or 8K for the 2,000-gallon or 8,000-gallon locations, respectively. At each of the UST excavations, five grab/discrete soil samples were collected from the sidewalls and bottom of each excavation at depths of eight to nine feet bgs after removal of the UST. Additionally, a duplicate sample was collected from the 8,000-gallon UST excavation. All soil samples were composited from representative material collected in the excavator bucket.

Confirmatory soil samples were submitted to AMRO Environmental Laboratories Corporation (AMRO) of Nerrimack, New Hampshire for analysis of volatile petroleum hydrocarbons (VPH) per MADEP VPH method, and extractable petroleum hydrocarbons (EPH) and four (4) polynuclear aromatic hydrocarbons (PAHs) per MADEP EPH methods. A QA sample (designated as 8KNQA) was submitted to Severn Trent Laboratories of Colchester, VT for the aforementioned analyses. Refer to Section 8.3 for QA sample details.

7.1 8,000-Gallon UST Location Sampling

The 8,000-gallon UST excavation samples are designated 8KN for the north wall, 8KS for the south wall, 8KE for the east wall, 8KW for the west wall, and 8KB for the bottom of the excavation. Additionally, a duplicate sample designated as 8KN2 was collected from the 8,000-gallon UST excavation.

A Quality Assurance sample designated as 8KNQA was collected at the 8KN location. Refer to Figure 3 for relative locations of analytical samples.

7.2 2,000-Gallon UST Location Sampling

The 2,000-gallon UST excavation samples are designated 2KN for the north wall, 2KS for the south wall, 2KE for the east wall, 2KW for the west wall, and 2KB for the bottom of the excavation.

8.0 SAMPLE ANALYTICAL RESULTS

8.0 SAMPLE ANALYTICAL RESULTS

The applicable reportable concentrations for the site are the MCP RCS-2. Refer to Section 4.2 for a discussion of the classification criteria.

The results of the laboratory analysis indicate the following:

8.1 Confirmatory Soil Sample Analytical Results - 8,000-Gallon UST Location

- EPH was not detected above the laboratory detection limits in the confirmatory soil samples. The laboratory detection limits ranged from 0.25 ppm to 0.5 ppm for the 8,000-gallon UST confirmatory soil samples.
- VPH was not detected above the laboratory detection limits in the confirmatory soil samples. The laboratory detection limits ranged from 0.05 ppni to 0.13 ppni for the 8,000-gallon UST confirmatory soil samples.

The detection limits are less than the applicable reportable concentrations for each of the target parameters.

8.2 Confirmatory Soil Sample Analytical Results - 2,000-Gallon UST Location

- EPH was not detected above the laboratory detection limits in the confirmatory soil samples. The laboratory detection limits ranged from 0.25 ppm to 0.5 ppm for the 2,000-gallon UST confirmatory soil samples.

VPH was not detected above the method 1 laboratory detection limits in the confirmatory soil samples. Ttic laboratory detection limits ranged from 0.05 ppni to 0.13 ppni for the 2,000-gallon UST confirmatory soil samples.

The detection limits are less than the applicable reportable concentrations for each of the target parameters.

Refer to Table 3 for a summary of the soil sample analyses. A copy of the laboratory reports is included in Appendix C.

8.3 Quality Assurance

In accordance with the approved Quality Assurance/Quality Control (QA/QC) Plan described in the approved SAP, a duplicate soil sample was submitted to Severn Trent Laboratories (STL) of Colchester, Vermont for analysis of EPH and VPH per EPA Methods.

The QA soil sample designated as 8KNQA was a duplicate sample of the sample collected from the northern sidewall of the 8,000-gallon US1 excavation. No VPH or EPH compound; were detected above RCS-2 reportable concentrations in the duplicate sample. The analytical data is included in Appendix C.

9.0 CONCLUSIONS AND RECOMMENDATIONS

The activities of November 1 and 2, 2000 are summarized as follows:

- The 8,000-gallon fuel oil UST was closed-by-removal at the subject site on November 2, 2000. The single-wall, steel UST was determined to be in good condition with no evidence of holes or other damage other than incidental damaging that incurred during removal.
- The 2,000-gallon fuel oil UST was closed-by-removal at the subject site on November 2, 2000. The single-wall, steel UST was determined to be in good condition with no evidence of holes or other damage.
- Soil encountered during the 2,000-gallon and 8,000-gallon UST removal activities was observed to be a finely graded fine to medium native sand and gravel backfill. No visual or olfactory evidence of a petroleum release was observed or detected during the soil removal activities.
- Field screening results of the soil encountered in the excavation and the temporary stockpile were below the action level of 25 ppni.
- Both excavations were backfilled with stockpiled soils and imported processed gravel.
- Laboratory analysis of ten composite soil samples and one duplicate sample, representative of remaining in-ground conditions, did not indicate the presence of EPH or VPH at concentrations exceeding the MCP RCS-2. No reportable situations were encountered that required the State of Massachusetts to be notified.
- Based on the observations and analytical results cited above, *Nobis* concurs with the USACE that no further investigations or remedial actions pertaining to the removed fuel oil USTs are necessary.

CERTIFICATE OF DISPOSAL/RECYCLING

Manifest # MA11133852

This is to certify that the material received from your facility has been managed at Environmental Compliance Corporation (ECC) or another licensed facility which has been approved by ECC in accordance with all applicable federal, state, and local laws, statutes, and regulations.

Recyclable material has been blended for use in accordance with all applicable federal, state, and local statutes, laws and regulations at ECC, a licensed facility,

All materials consolidated at ECC and subsequently shipped to another licensed facility for treatment and disposal, shall be identified as being generated by ECC.

ECC shall indemnify the generator from *my* claims as result of damage to any property, contamination of, or adverse effects on the environment, any violation of governmental laws, regulations, or orders, caused by treatment and disposal of the material specified on the manifest.

APPENDIX B

APPENDIX B

FIELD PROCEDURES

Field Screening of Soils

The soil samples collected during drilling were screened for total concentrations of volatile organic compounds (VOCs) using a MicroTIP organic vapor meter equipped with a photoionization detector (PID). The MicroTIP PID is equipped with a 10.6 eV bulb and has a detection limit of 1 part per million (ppm) by volume referenced to an isobutylene-in-air standard. The tightly-capped soil samples were allowed to equilibrate to room temperature. Immediately prior to screening, the jar sample was shaken vigorously for approximately 30 seconds. A measurement of the total VOCs within the headspace of the jar sample was then obtained by loosening the cap, slightly lifting one side of the cap, and inserting the PID probe tip between the lip of the jar and the cap. The maximum PID reading was recorded and the cap was placed back on the jar.

RE: 67026 Chicopee, MA

Order No.: 001 1033

Dear Amy Adams:

AMRO Environmental Laboratories Corp. received 12 samples on 11/3/00 for the analyses presented in the following report.

AMRO operates a Quality Assurance Program which meets or exceeds EPA and state requirements. A copy of the appropriate State Certificate is attached. The enclosed Sample Receipt Checklist details the condition of your sample(s) upon receipt. Please see the enclosed Case Narrative for quality control deviations that were encountered during the analyses associated with this project.

Please be advised that any unused sample volume and sample extracts will be stored for a period of thirty (30) days from this report date. After this time, AMRO will properly dispose of the remaining sample(s). If you require further analysis, or need the samples held for a longer period, please contact us immediately.

This letter is an integral part of your data report. If you have any questions regarding this project in the future, please refer to the Order Number above.

Sincerely

Nancy Stewart
Vice President / Lab Director

CASE NARRATIVE

0011033

GENERAL

1. No QC deviations were observed.

MADEP-VPH

SOIL

1. No QC deviations were observed.

MADEP-EPH

SOIL

1. The batch duplicate was performed on sample 0011041-01B. The %RPD for Phenanthrene was 100% outside the laboratory control limit (50%).
2. No other OC deviations were observed.

Volatile Petroleum Hydrocarbons (VPH)
Massachusetts Department of Environmental Protection (MADEP)
Method 1.0 - January 1998
AMRO Modifications

This modification is based on the use of a purge and trap gas chromatography mass spectrometer (GC/MS) system to analyze samples for VPH. The hydrocarbon ranges are quantified using predominant mass fragmentation ions which are characteristic for the range being measured. This approach eliminates potential false positives for the target analytes while providing accurate hydrocarbon range data.

The chromatographic column is an HP-624 capillary column which has been validated by GCMS analysis of a gasoline standard to correctly identify the marker compounds and elution order of specific gasoline components. Batch quality control includes, at a minimum, method blank, laboratory control sample, and duplicate analysis. A matrix spike and/or matrix spike duplicate is analyzed if sufficient sample is submitted to the laboratory.

The Reporting Limit (RL) of this method for each of the collective aliphatic and aromatic ranges is approximately 0.6-2.8 mg/kg in soil and 25-110 µg/L in water. The RL of this method for the target analytes ranges from approximately 0.05-0.13 mg/kg in soil and 2.0-5.0 µg/L for water samples.

Extractable Petroleum Hydrocarbons (EPH)
Massachusetts Department of Environmental Protection (MADEP)
Method 1.0 - January 1998
AMRO Modifications

This modification is based on a solvent extraction and gas chromatography mass spectrometer (GC/MS) analysis. The hydrocarbon ranges are quantified using predominant mass fragmentation ions which are characteristic for the range being measured. This approach eliminates the silica gel solid-phase fractionation step. False positives for targeted PAH analytes are eliminated by using GC/MS as the primary analysis technique.

The chromatographic column is a J&W Scientific DB-5ms capillary column. Internal standard calibration is performed using 5 α -Androstane at a concentration of 40 ng/µL. o-Terphenyl and 1-Chlorooctadecane are added as surrogate compounds at 20 ng/µL in the sample extract. These two surrogates monitor the effects of the sample matrix and extraction efficiency. Two additional surrogates, 2-Fluorobiphenyl and 2-Bromonaphthalene, are added to the finished extract prior to analysis to monitor instrument performance. Batch quality control includes, at a minimum, a procedure blank, laboratory control sample and duplicate sample analysis. A matrix spike is analyzed if sufficient sample is submitted to the laboratory.

The Reporting Limit (RL) of this method for each of the collective aliphatic and aromatic ranges is approximately 2-15 mg/kg in soil and 10-50 µg/L in water. The RL of this method for the Target PAH analytes ranges from approximately 0.25 to 0.5 mg/kg in soil, 1.0 µg/L for water when operating the GC/MS in full scan mode, and 0.1 to 1.0 µg/L when operating the GC/MS in SIM mode. For sites requiring the lowest levels cited in the Massachusetts Contingency Plan for water, GC/MS in the Selected Ion Monitoring (SIM) mode is used.

Hydrocarbon range data exclude concentrations of any surrogate(s) and/or internal standards eluting in that range. EPH: C11-C22 Aromatic Hydrocarbons exclude the concentration of target PAH analytes. VPH: C5-C8 Aliphatic Hydrocarbons exclude the concentration of target analytes eluting in this range. C9-C12 Aliphatic Hydrocarbons exclude the concentration of target analytes eluting in this range and concentration of C9-C10 Aromatic Hydrocarbons.

CERTIFICATION

Were all QNQC procedures required by the VPH or EPH method followed: Yes No - If No, See Case Narrative
 Were all performance/acceptance standards for required QNQC procedures achieved: Yes No - if No, See Case Narrative
 Were any significant modifications made to the method as specified in section 11.3: No Yes - Details enclosed
 I attest under the pains and penalties of perjury that, based upon my inquiry of those individual: immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete

Hydrocarbon range data exclude concentrations of any surrogate(s) and/or internal standards eluting in that range. EPH: C11-C22 Aromatic Hydrocarbons exclude the concentration of target PAH analytes. VPH: C5-C8 Aliphatic Hydrocarbons exclude the concentration of target analytes eluting in this range. C9-C12 Aliphatic Hydrocarbons exclude the concentration of target analytes eluting in this range and concentration of C9-C10 Aromatic Hydrocarbons.

CERTIFICATION

Were all QNQC procedures required by the VPH or EPH method followed: Yes No - If No, See Case Narrative
 Were all performance/acceptance standards for required QA/QC procedures achieved: Yes No - If No, See Case Narrative
 Were any significant modifications made to the method as specified in section 11.3: No Yes - Details enclosed

I attest under the pains and penalties of perjury that, based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

FEDERAL RECORDS

DOD: Consists of federally owned or administered lands, administered by the Department of Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

A review of the DOD list, as provided by EDR, and dated 12/31/2004 has revealed that there is 1 DOD site within approximately 1 mile of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
WESTOVER AIR FORCE BASE		0 - 1/8	0	6

FUDS: The Listing includes locations of Formerly Used Defense Sites Properties where the US Army Corps Of Engineers is actively working or will take necessary cleanup actions.

A review of the FUDS list, as provided by EDR, and dated 12/05/2005 has revealed that there is 1 FUDS site within approximately 1 mile of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
WESTOVER AFB		1/4 - 1/2NNE	6	14

STATE AND LOCAL RECORDS

SHWS: Contains information on releases of oil and hazardous materials that have been reported to DEP.

A review of the SHWS list, as provided by EDR, and dated 04/18/2006 has revealed that there are 17 SHWS sites within approximately 1 mile of the target property.

 RAB: Not reported

Actual:
249 ft.

FUDS History : The 15.13 acres composing the bulk petroleum, oil, and lubricants terminal were acquired as a part of the overall acquisition of Westover Air Force Base in 1939 and 1940 through purchase condemnation. The terminal was used throughout its ownership by the Air Force as a fuel storage facility.

FUDS Description : The former Westover Air Force Base is located approximately 1 mile north and 1 mile east of the intersection of the Massachusetts Turnpike and State Highway Rte. 33. There are two sites, which were formerly used as a bulk petroleum, oil, and lubricants terminal area (approximately 15.1 acres) and a salvage yard (approximately 2.8 acres).

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/19/2006	Source: EPA
Date Data Arrived at EDR: 05/05/2006	Telephone: N/A
Date Made Active in Reports: 05/22/2006	Last EDR Contact: 08/02/2006
Number of Days to Update: 17	Next Scheduled EDR Contact: 10/30/2006
	Data Release Frequency: Quarterly

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL RECOVERY: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991	Source: EPA
Date Data Arrived at EDR: 02/02/1994	Telephone: 202-564-4267
Date Made Active in Reports: 03/30/1994	Last EDR Contact: 05/23/2006
Number of Days to Update: 56	Next Scheduled EDR Contact: 08/21/2006
	Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/01/2006	Source: EPA
Date Data Arrived at EDR: 03/21/2006	Telephone: 703-413-0223
Date Made Active in Reports: 04/13/2006	Last EDR Contact: 06/22/2006
Number of Days to Update: 23	Next Scheduled EDR Contact: 09/18/2006
	Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 02/01/2006	Source: EPA
Date Data Arrived at EDR: 03/21/2006	Telephone: 703-413-0223

RCRA: Resource Conservation and Recovery Act Information

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients--States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 04/26/2006	Source: Environmental Protection Agency

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

Date of Government Version: 11/04/2005	Source: Department of Energy

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

Date of Government Version: N/A	Source: EDR, Inc.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)

Source: United States Geologic Survey

A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Elevation:	235 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	42072-B5 SPRINGFIELD NORTH, MA
Most Recent Revision:	1979

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

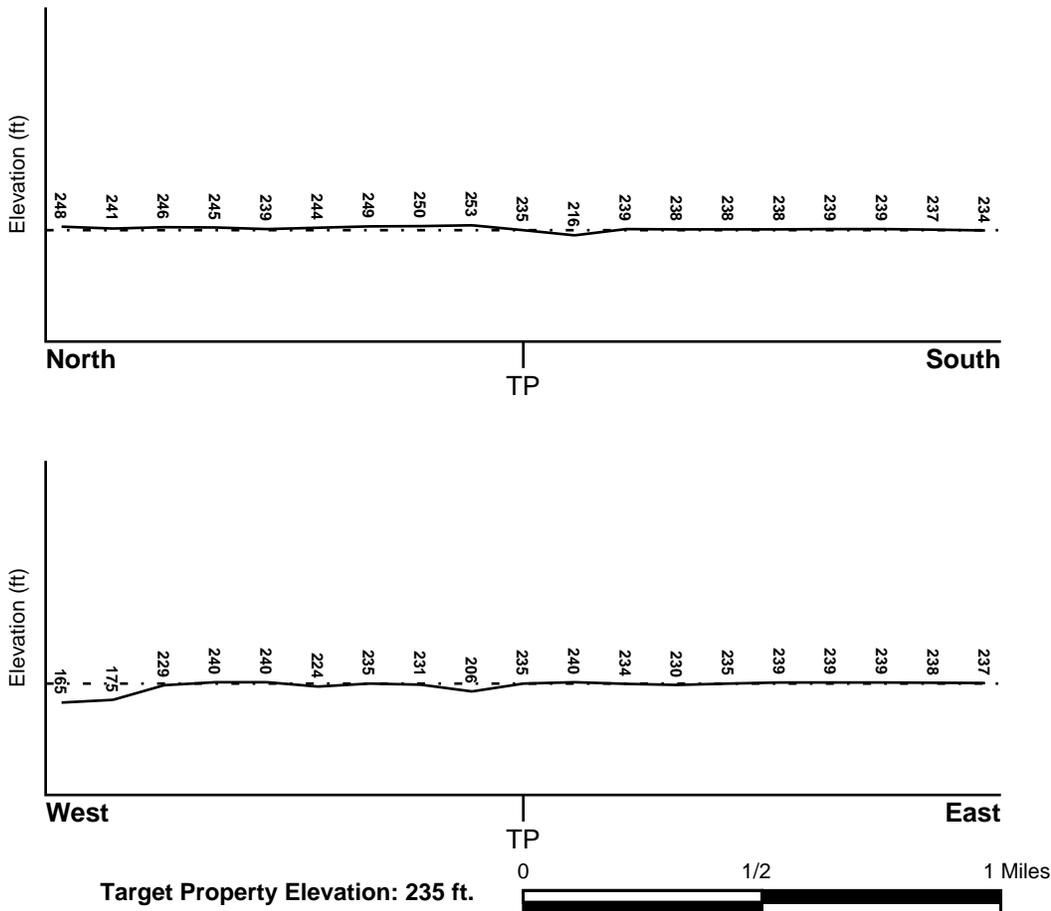

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> HAMPDEN, MA	<u>FEMA Flood Electronic Data</u> YES - refer to the Overview Map and Detail Map
Flood Plain Panel at Target Property:	0000000000
Additional Panels in search area:	2501370005A 2501370010A

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> SPRINGFIELD NORTH	<u>NWI Electronic Data Coverage</u> YES - refer to the Overview Map and Detail Map
---	---

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Mesozoic
System: Triassic
Series: Triassic

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinator soil types may appear within the general area of target property.

Soil Surface Textures: fine sandy loam
silt loam
very fine sandy loam

Surficial Soil Types: fine sandy loam
silt loam
very fine sandy loam

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: fine sandy loam
channery - silt loam
gravelly - loamy sand
silt loam
loamy fine sand
stratified
gravelly - sandy loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)

Source: United States Geologic Survey

A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Massachusetts Geographic Information System (MassGIS) Datalayers

Source: Executive Office of Environmental Affairs

Public Water Supply Database: The Public Water Supply datalayer contains the locations of public community surface and groundwater supply sources and public non-community supply sources as defined in 310 CMR 22.00.

OTHER STATE DATABASE INFORMATION

Areas of Critical Environmental Concern Datalayer: The Areas of Critical Environmental Concern (ACEC) datalayer shows the location of areas that have been designated ACECs by the Secretary of Environmental Affairs. ACEC designation requires greater environmental review of certain kinds of proposed development under state jurisdiction within the ACEC boundaries. The ACEC Program is administered by the Department of Environmental Management (DEM) on behalf of the Secretary of Environmental Affairs. The Massachusetts Coastal Zone Management (MCZM) Office managed the original Coastal ACEC Program from 1978 to 1993, and continues to play a key role in monitoring coastal ACECs. Procedures for ACEC designation and the general policies governing the effects of designation are contained in the ACEC regulations (301 CMR 12.00). The ACEC datalayer has been compiled by MCZM and DEM and includes both coastal and inland areas.

EPA Designated Sole Source Aquifers Datalayer: The Sole Source Aquifer datalayer was compiled by the Department of Environmental Protection (DEP) Division of Water Supply (DWS). Seven Sole Source Aquifers have been designated by the US Environmental Protection Agency (EPA) for Massachusetts. A Sole Source Aquifer (SSA) is an aquifer designated by US EPA as the sole or principal source of drinking water for a given aquifer service area; that is, an aquifer which is needed to supply 50% or more of the drinking water for that area and for which there are no reasonably available alternative sources should that aquifer become contaminated. The aquifers were defined by a EPA hydrogeologist.

Aquifers Datalayer: MassGIS produced an aquifer datalayer composed of 20 individual panels, generally based on the boundaries of the major drainage basins. Areas of high and medium yield were mapped. This datalayer includes polygon attribute coding to help in the identification of areas in which cleanup of hazardous waste sites must meet drinking water standards, as defined in the Massachusetts Contingency Plan (MCP) (310 CMR 40.00000).

DEP Approved Zone IIs Datalayer: The Department of Environmental Protection (DEP) approved Zone IIs datalayer was compiled by the DEP Division of Water Supply (DWS). The database contains 281 approved Zone IIs statewide. As stated in 310 CMR 22.02, a Zone II is "that area of an aquifer which contributes water to a well under the most severe pumping and recharge conditions that can be realistically anticipated (180 days of pumping at safe yield, with no recharge from precipitation.) It is bounded by the groundwater divides which result from pumping the well and by the contact of the aquifer with less permeable materials such as till or bedrock. In some cases, streams or lakes may act as recharge boundaries. In all cases, Zone IIs shall extend up gradient to its point of intersection with prevailing hydrogeologic boundaries (a groundwater flow divide, a contact with till or bedrock, or a recharge boundary)." These data are used in association with the Public Water Supplies datalayer. The following describes certain unique features of this association.

- Any proposed new well which will pump at least 100,000 gallons per day must have a Zone II delineation completed and approved by DEP prior to the well coming on line.
- Additionally, a new source may not be on-line yet, but other, older wells may fall within its Zone II boundary.
- Further, existing wells must have a Zone II delineated as a condition of receiving a water withdrawal permit under the Water Management Act.

Area Radon Information

Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones

Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.
